Enterprise arrives

AFTER one of the longest production delays yet in the home computer industry, the 64K Enterprise computer should begin to trickle through to the shops before Christmas.

"We are beginning supplies to Prism, our distributors, this week," said Enterprise's marketing manager Mike Shirley. "Before Christmas, the computer will only be available

in nominal quantities but we hope to reach full production by February 1985."

Originally priced at just under £200, the Enterprise will now cost £249.95.

Tramiel talks in UK

ATARI boss Jack Tramiel paid a flying visit to the UK last week to outline the company's plans for next year — including the launch in January of a new 16-bit 68000 machine for under £300.

Atari plans to develop four different 'families' of computers.

It will continue to produce the 2600J and Jr video games

Atari boss
Jack Tramiel

machines in the video console range.

A series of four 8-bit machines is planned, comprising

a redesigned version of the 800XL (64K), a 128K model, a new version incorporating a music keyboard, and a portable lap-held model.

The new 16-bit micro, based on the 68000 processor, will use a new operating system, to be called TOS (Tramiel operating system) jointly developed by Atari and Digital Research. Di-

Timefame gains support

TIMEFAME International's removal from BT's Prestel service has sparked off minor security breaches on BT's prestige Telecom Gold system.

Computer giants ICL discovered messages left by hackers in mail-boxes used for demonstration purposes, referring to Timefame's removal.

Timefame has also received messages of support for its action from MPs — through the post — and one from the editor of the Micromouse database on Micronet 800.

Timefame's removal came after a chain of events dating back to the Prestel breach of security at the beginning of November, when personal mail boxes including that of Prince Philip were broken into (see *Popular Computing Weekly*, November 8).

After those incidents Prestel changed all its information providers' (IPs) codes.

Timefame then discovered that some of its pages had been used over a weekend and the company notified British Telecom of this apparent lapse.

Timefame claims there was no response from British Telecom regarding any investigation into a breach of files after the change of identity codes.

On November 28, Timefame prepared a notice to go into its 'letterbox', an area where Ti-

INSIDE } MSX CLONES COMPARED } MINTER LISTING }

THE BIG THREE

THREE ESSENTIAL PACKAGES CAN BE YOURS FOR WELL UNDER THREE FIGURES!

DATABASE

Micro Magpie for the Commodore 64 is probably the most advanced database management system available for any home micro. With Micro Magpie you can create a database system tailored exactly to your own information handling requirements.

With most database systems, you only get out what you put in. Micro Magpie gives you more! It can manipulate data between different files, perform calculations on numerical data, print out reports, and hardcopy data in graphical form. Only Micro Magpie can give you all these features.

- * Fully user programmable database management system.
- * Operated by easy-to-use pop-up menus using just four keys.
- * 100% machine code program for speed and compactness.
- * Can perform complex calculations on numerical data.
- * Searches on any field, with wild card and part-field matching.
- * Works with one or two 1541 disk drives.
- * Horizontal or vertical bar graph or scatter graph output.
- * Integral Centronics interface for parallel printer option.
- * Professionally written instruction manual.
- * Help readily available from Help Disk
- * Free application templates - Mailing List and Stock Control.

Micro Magpie would be excellent value if you bought it for the applications alone! You can have a highly sophisticated Mailing List system up and running within minutes, and you'll still be using only a fraction of Micro Magpie's potential! Once you start tailoring your own custom applications, you will begin to discover why Commodore User magazine called Micro Magpie "the software bargain of the year"!

MICRO MAGPIE - ON DISK ONLY

£39.95 inc VAT

SPREADSHEET

Micro Swift - the affordable professional spreadsheet system for the Commodore 64. Micro Swift will prove indispensable in business or around the home to construct models of income and expenditure, for carrying out instant 'what-if' calculations to see how a change in one or more figures affects all the other figures, or for specialised applications where complex number crunching is required.

Micro Swift is unique in that it is operated by pop-up menus, a system pioneered by our Magpie database program. No longer do you have to memorise a whole hierarchy of commands and control keys - the menus appear when you want them, and disappear when you don't.

Micro Swift is written totally in machine code (beware other spreadsheets in Basic!) for speed and compactness, giving you more room to construct more complex models.

Micro Swift gives you these amazing features...

- * A1 to Z254 cell matrix.
- * Variable cell widths.
- * Split screen facility.
- * User definable numerical precision and display formatting.
- * Integral Centronics Interface for parallel printer option.
- * Automatic execution of user-programmed sequences.
- * Graphical display option.
- * Operated by easy-to-use pop-up menus.
- * Free ready-programmed applications included.
- * File storage on disk or cassette.
- * Full instruction manual included.

Don't be fooled by the price! Micro Swift gives you facilities equal, if not superior, to spreadsheets costing many times more. Micro Swift is available on disk or cassette. Micro Swift - Spreadsheet power to the people!

MICRO SWIFT - ON DISK OR CASSETTE

£19.95 inc VAT

WORD PROCESSOR

Micro Wordcraft is our new disk-based professional word processor. It is a direct descendant of the highly respected Wordcraft program, which is in use world-wide on the larger Commodore machines, Sirius, and IBM PC, etc. Written in 100% machine code, Micro Wordcraft spells affordable office quality word processing for the home or business user.

It is often said that "you get what you pay for", but with the Audiogenic Professional Series you get what you pay for and more! Micro Wordcraft gives you all these advanced facilities:

- * Full text control - document width up to 99 columns, tabs, decimal tabs, justification and centering.
- * Full text manipulation - on-screen editing, block move, block delete, string search and replace, underlining and emboldening.
- * Scrolling screen display, uncluttered by control characters.
- * Name and address files can be created and merged into standard letters.
- * Easy merging of standard paragraphs. Compatible with Commodore, parallel and RS232 printers.
- * Integral Centronics interface for parallel printer option.
- * Instantly accessible Help screens.
- * Comprehensive instruction manual included.

The name and address merging capabilities of Micro Wordcraft make it an ideal tool for small businesses, clubs, societies or hobby groups, where there are regular mailings of standard letters. For home use, Micro Wordcraft contains all the facilities you could ever need, at a price you can easily afford!

MICRO WORDCRAFT - ON DISK ONLY

£24.95 inc VAT

The Audiogenic Professional Series represents a price breakthrough for business-orientated software products. With Micro Magpie, Micro Swift, and Micro Wordcraft, the power and convenience of the computerised office can be a reality for all Commodore 64 owners!

Each of the three products represents the state of the art in its particular field. Great care has been taken over the documentation to make sure that you, the user, can quickly make use of the facilities available. Also, a full backup service is provided by the Audiogenic Technical Department, who are only a phone call away if you have any queries about the products.

So, whether it's for your home, business, club or society, make sure you go for the Audiogenic Professional Series!

POPULAR Computing

WEEKLY

It seems the near-mythical Enterprise will shortly be with us.

Production of the machine, which was first announced 15-16 months ago, has been dogged by an unprecedented series of delays. Not only that, but the company behind the micro has gone through more identity crises in that time than would seem credible — first Samurai, then Elan, then Flan (muffled laughter) and now Enterprise.

When first conceived the 48K Spectrum was still £175. The Oric Atmos had yet to appear. The QL, Spectrum+, Commodore Plus/4 and C16 were all but a twinkle in their designers' eyes.

In 1983 the Enterprise was greeted enthusiastically by potential buyers, press and programmers alike. Its £199 price made it an exceptional machine.

How does it look now? Now it costs £280. Is it still a world beater?

In fact, the machine has withstood the passage of time remarkably well. Where it was excellent, it is now merely competitive.

The Enterprise has been lucky that the QL got off on the wrong foot. Lucky that Commodore's Plus/4 adds so little to the C64. And lucky that the Japanese MSX design was so conventional and cautious.

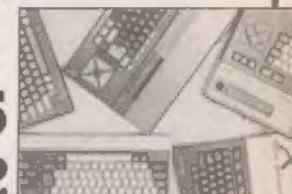

So — despite being a little overpriced, and even though its initial software support looks weak — the Enterprise still looks quite attractive.

But the Spectrum and Atari 800XL (both at £129) represent fierce competition.

Moreover, next year, Atari's £300 16-bit machine and Commodore's C128 and Amiga machines are likely to quickly overshadow the Enterprise.

Enterprise

continued from page one
RS423 and Centronics interfaces, a ROM slot which can handle up to 64K ROM cartridges and stereo sound output. A structured Basic is included, together with a built-in word processor.

The Enterprise has a flexible range of graphic modes — fifteen in total — dictated by the number of colours the user wishes to display on screen. There is also a choice of two text modes — 40 cols or 80 cols.

A very limited amount of software will also be available at launch. Four arcade programs written entirely in Basic will be released this year.

"Obviously we will be doing a wide range of machine code games later, but at least we're getting some out," Mike continued.

The four packs, labelled Starter Software, comprise *Dictator*, a strategy game, *Five in a Row*, a ball game simulation, and two simply entitled *Games Pack 1* and *Games Pack 2*.

"These are simple games where the user is encouraged to break into the program to see how they work," said Stephen Gandy, Enterprise's product manager. "These will each be priced at £5.95, though our later games will probably be nearer the £7.95 mark."

Timeframe

continued from page one
Timeframe invites Prestel users to place and exchange messages and letters of topical interest. The notice stated that there could be a possibility of a 'mole' in British Telecom itself.

The notice was displayed on Prestel late on November 28 and the next day, Timeframe received a letter from British Telecom stating that Timeframe was in breach of a clause in the Prestel contract, stating that subscribers should not bring BT or Prestel into disrepute. Timeframe was asked to remove its letterbox notice and display a retraction.

The retraction asked for was not printed, and Timeframe was blacked from Prestel within hours.

Timeframe is apparently now seeking a court injunction against its blacking by BT.

Timeframe declined on Friday to comment on the situation.

Intelligent Software has written a range of twelve products, due out in February under the Enterprise label. These include an assembler/disassembler, *Chess*, *Lisp* and *Forth* languages, an arcade game, *Jungle Jim*, and *Nightmare Knight*, a graphic and text adventure.

A number of software houses are also working to produce program conversions for the Enterprise, including Quicksilva and Mikro-Gen.

On the peripherals side, Enterprise plans to release, under the Enterprise name, a medium resolution monitor manufactured by Microvitec, for £329.95 and a Marnesman Tally dot-matrix printer, running at 100 cps, at around £230.

The company is also talking to Kempston about the possibility of producing further peripherals for the machine.

"We will be releasing both single and dual disc drives, running standard 3½ inch discs and with CP/M built in," Stephen continued. The price for the dual system will probably be £899.95 or similar."

These products, plus the 128K version of the computer, are all scheduled for release in the first half of next year.

The Enterprise is being manufactured in Perth, Scotland, by GRI Electronics.

Kicking off

OCEAN has released *Match Day*, a football simulation game for the Spectrum.

For either one player (playing against the computer), or two players, you control your side's movements on pitch.

Ocean is not planning any versions for other machines at the moment. *Match Day* costs £7.95.

● A BBC 2 documentary *Commercial Breaks* being shown tonight (December 13) at 8.00pm visits both Ocean and Imagine, the Liverpool company which folded last summer.

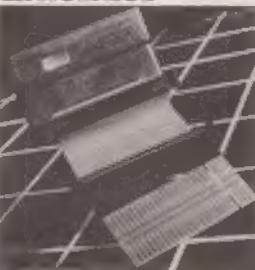

Acorn cuts US drive

DISAPPOINTING sales in the US of its BBC micro has led Acorn to drastically reduce its presence in the United States.

Acorn opened an office with around 40 staff and a warehouse in the US about a year ago. It planned to capture 10% of the educational market with the BBC, buying the US rights to the BBC's educational television series based on the computer.

"Acorn's optimism wasn't justified and the market impact turned out to be far less than 10%", said an Acorn spokesman.

Extender

If you find your Spectrum edge connectors are wearing thin, Kempston has brought out an Extender Cable, to give a flexible connection between the Spectrum or Spectrum+ and any Kempston interface.

The Extender is also fitted with a replaceable edge card. The device is priced at £7.94. Details from Kempston Micro Electronics, Unit 30, Singer Way, Woburn Road Industrial Estate, Kempston, Beds.

Elite bug is removed

THE bug in Acornsoft's Electron version of its top-selling game *Elite* is to be removed (see *Popular Computing Weekly*, December 6).

Electron owners who bought *Elite* discovered they could not 'hyperdrive' from one galaxy to another as on the BBC version.

"A new version of the game is being brought out, we hope before Christmas, in which you can 'galactic hyperspace,'" said an Acorn spokeswoman.

"Acorn will offer replacements to those who have already bought *Elite* on the Electron."

"Acorn has reduced its US facility by around 80% which brings it more in line with its US sales," he continued. "However, there is still a small office out there to deal with software support for schools which have taken the BBC."

Acorn is also retaining its research facility at Palo Alto in California.

● Acorn's share price dropped 14p to 61p last week, after the news that it had cut down its US operation. This compares with a striking price per share of 120p when Acorn entered the USM fourteen months ago.

Emulator for CBM 64

A NEW emulator to enable the Commodore 64 to run BBC Basic has been developed by a group of companies.

CH Co-ordinates, Aztec and Milton Keynes Music and Computers, have written the emulator between them.

"The hardware differences between the machines mean that the emulation isn't exact to the last detail," said a spokesman for the consortium.

Most machine-code programs cannot be run using the emulator on the C64 but programs written entirely in BBC Basic should work.

"The main aim of the emulator is to enable schoolchildren owning a C64 to do homework from their school's BBC."

The BBC Emulator should be in the shops next week, priced at £14.95 on cassette.

Micronet — a correction

AN ITEM headed "Prestel Breached" in the December 6 issue said that on December 2 a group of hackers had broken into Micronet's sub information provider *Micromouse* leaving the message "Bring back Timeframe — hack of the century". The article described this as a serious breach of security.

In fact the Editor of the *Micromouse* database put up the message "Bring back Timeframe '8181 # R-A-OK" in connection with a story headed "The Ultimate Hack" screened on December 3 with the full knowledge of Micronet. There was no question of Micronet's security having been breached.

gital Research's applications package, *Gem*, will be bundled with the machine.

At the top of the range, Atari is developing a 32-bit work station for professional use, based on the National Semiconductor 3233 processor.

The 8 and 16-bit machines will be shown at the Winter Consumer Electronics show in Las Vegas in January.

"The redesign of the 800XL will be largely a rehousing job," said Jack Tramiel. "It will be compatible with the existing version — indeed the whole 8-bit range will be compatible.

"For the 16-bit machine, we have a number of peripherals lined up — disc drives with storage capacities of 1/4 megabyte up to 20 megabytes on a hard disc drive, and four different printers.

"The 16-bit machine will not be compatible with IBM or Apple models. TOS is a proprietary operating system. I do not compete with IBM — I make PCs for the masses, and

leave the business side to IBM."

Tramiel stressed that all the new machines were aimed at a mass market — a policy reflected in the provisional prices. The Atari 800XL is expected to remain at £129, and prices for the new 8-bit range will be comparable. Atari plans to price the 16-bit at around £300, and the 32-bit at "below \$1000", and thus under £900.

All the new products will be available in the UK — around April for those launched at CES, and June-July for the 32-bit workstation.

On the software side, Atari plans to develop further the role of AtariSoft. AtariSoft has added a new line of products, and we want to develop Atari implementations of best-selling games. I'm also looking carefully at the pricing — and possible reductions to be made in January," said Tramiel.

"There will be a small software base for the 16-bit when it comes out, and Atari has access to the entire Digital Research library. You can expect a number of languages such as Dr Logo, Pascal and

Fortran to be available when the machine comes out."

Tramiel hopes that by the end of December Atari will have broken even — a sharp turnaround, as Atari was losing £10m per month when it was part of Warner Comms.

He plans to raise further finance for the company through a private placement within the next few months, and intends Atari to go public next summer.

Tramiel says he has now settled over 85% of creditors' claims outstanding when he took over Atari in June.

C16 in flight

ONE of the first releases for Commodore's new C16 computer is *Craig Communications' Flight 018*.

Programmer John Wagstaff (see *Popular Computing Weekly*, October 11) has written an enhanced version of his original Vic 20 game. The C16 version features five skill levels, a more sophisticated landing routine, and continuously up-dated status reports.

Flight 018 for the C16 is being released this week at £5.95.

A musical showing

MUSIC was the predominant theme at the Electron and BBC Micro User Show, held at the Royal Horticultural Society's Hall on December 6-9.

Acorn's own Music 300 synthesiser for the BBC, launched month ago at Compex was demonstrated as was a fully digital synthesiser, The Clef, from Computer Music Systems, also for the BBC.

The latter costs a hefty £495.00 for the full system comprising keyboard, PDSG tone generation system, power supply and software on disc.

Island Logic' Music System is slightly different, being a software package to play or create tunes with just the micro, using on-screen icons for menu selection. *Music System* costs £24.95 on disc, and £12.95 on cassette.

Slogger Advanced Systems showed its Rombox Rom expansion unit for the Electron, while Aries Computers had a 20K BBC Ram expansion pack on view.

MEGA-SOUND

FOR SPECTRUM 48K

Compatible with ZX Spectrum +

Achieve amazing sound capabilities
that your Spectrum has been lacking.

The Cheetah Mega-Sound simply plugs into the user port at the rear of your computer and enables the Spectrum sound to be amplified through your T.V., providing you with a whole new sound dimension. The Spectrum "Beep" will also be amplified through the T.V., ensuring confidence when pressing keys during programming.

Knocking spots off MSX

OK, so I have been forced to eat humble-pie. Since writing to you in praise of the MSX concept I have to admit my opinion has undergone a complete reversal!

I have now had hands-on experience of many of these new machines, and they fall down in a number of very important respects.

The keyboards on some of the machines are really quite terrible — very unresponsive, failing to register key-presses unless one is very careful. In some cases, even the Spectrum's is better!

The picture quality produced by the MSX's is not as good as one was lead to believe. The Spectrum knocks spots (or should I say pixels?) off them.

Also, I am amazed at the high quality of the new breed of games now coming on to the market for the existing machines. *Lords of Midnight* was but a forerunner of some truly unbelievable programs — *Tir Na Nog*, *Deus ex Machina*, *Knight Lore* and *Swords and Sorcery*.

These programs' complexity overcomes all my objections concerning the Spectrum, and make it by far the best buy on the market. It is difficult to see how the MSX companies can justify such high prices.

ment is completely different. The author, Colin Opie, wrote the book in consultation with Tony Tebby as Technical Adviser, and they are somewhat sceptical about your reviewer's qualifications to comment on technical accuracy.

The expression "uncannily similar to those in the book's rival", would be thought by any fair-minded traveller on the Clapham Omnibus to mean at worst plagiarism and at least sharp practice. It is true that each book contains a clock program. They are, however, manifestly different; in our book it is an analogue clock which counts seconds, for example. The similarities in the program appear to us to be very superficial.

Finally, it is not true that our book is "more expensive". Both books are £12.95.

In general publishers accept comment and criticism, even when it expresses a reviewer's misconceptions and prejudices, however, we feel that this review goes beyond that and was in our view unfair.

Jeremy Dicks

Software Sales Manager
McGraw-Hill Book Co
Shoppenhangers Road
Maidenhead
Bucks

QL Assembly Language Programming contains a number of inaccuracies which are found in Sinclair's *QDOS Manual*.

Sinclair itself has warned of possible errors in the preliminary *QDOS* manual.

A couple of examples: the

Edit Line description is very misleading and the necessary method for turning the microdrives is not even mentioned.

The programs in the two books are substantially different and both books are priced at £12.95, but I have to say that I still prefer Adder's *Advanced User Guide*.

In my view the only additional technical material compared to the *QDOS Manual* in the McGraw-Hill book is the program listings themselves — Bill Hoskins.

Pleased for the Amstrad

Computer wilderness

PCW is clearly the most popular and heavily used magazine to which this school subscribes, so much so that we need two copies per week. However, despite its undoubted popularity with a substantial proportion of our 1877 students, aged 12-18, many express disappointment that the RML 380Z and RML 480Z computers seem only to be the subject of an occasional letter, usually from another teacher.

They seem to forget that the people being forgotten are the very same people who not so long ago supported them by buying their games and magazines.

Keep the Dragon articles flowing.

A E Standing
32 St David's Close
Iver Heath
Bucks

No one could possibly expect a popular weekly magazine to be able to extend coverage to every single micro in use, but if one were to compile statistics reflecting micros used by, rather than bought by, children and young people, I suspect that the RML machines would rank very highly.

An occasional mention of these machines would be justified and might even serve to enhance your sales to schools and young people. Please help our young students to escape the feeling that their school computing is in a sort of wilderness as far as the press is concerned.

D R Schofield
School Librarian
The Ousedale School
Newport Pagnell
Bucks

The only reason the Research machines are featured so rarely in these pages is simply that we are never sent programs to review for them, presumably because such software is exclusive to schools. Nor do our readers send us program listings for people to type in which run on them. We can only reflect what we are sent.

Freezing the QL

I'm not sure if many QL owners know this but, pressing Control and F5 seems to freeze the computer. It can then be unfrozen by pressing any key.

This is useful because when you are listing a long program it can be stopped and started to view it easily.

Even the Psion programs — a long *Quill* document, for example, can be stopped using the two keys.

The BBC Microcomputer System. The world's best. And still growing.

The BBC Microcomputer System is designed, produced and distributed by Acorn Computers Ltd.

Gravitar

Can you guide your ship safely through the galaxy in
Gravitar for 48K Spectrum, by Jim Arovan

Gravitar, for the 48K ZX Spectrum is a version of what I believe to be the best vector scan arcade game ever written. It consists of flying to many different planets, destroying enemy defence sites and collecting enough fuel to keep your ship going. The crowning achievement of the game is blasting the reactor on the final planet in each galaxy. On doing this, you are teleported to a new galaxy.

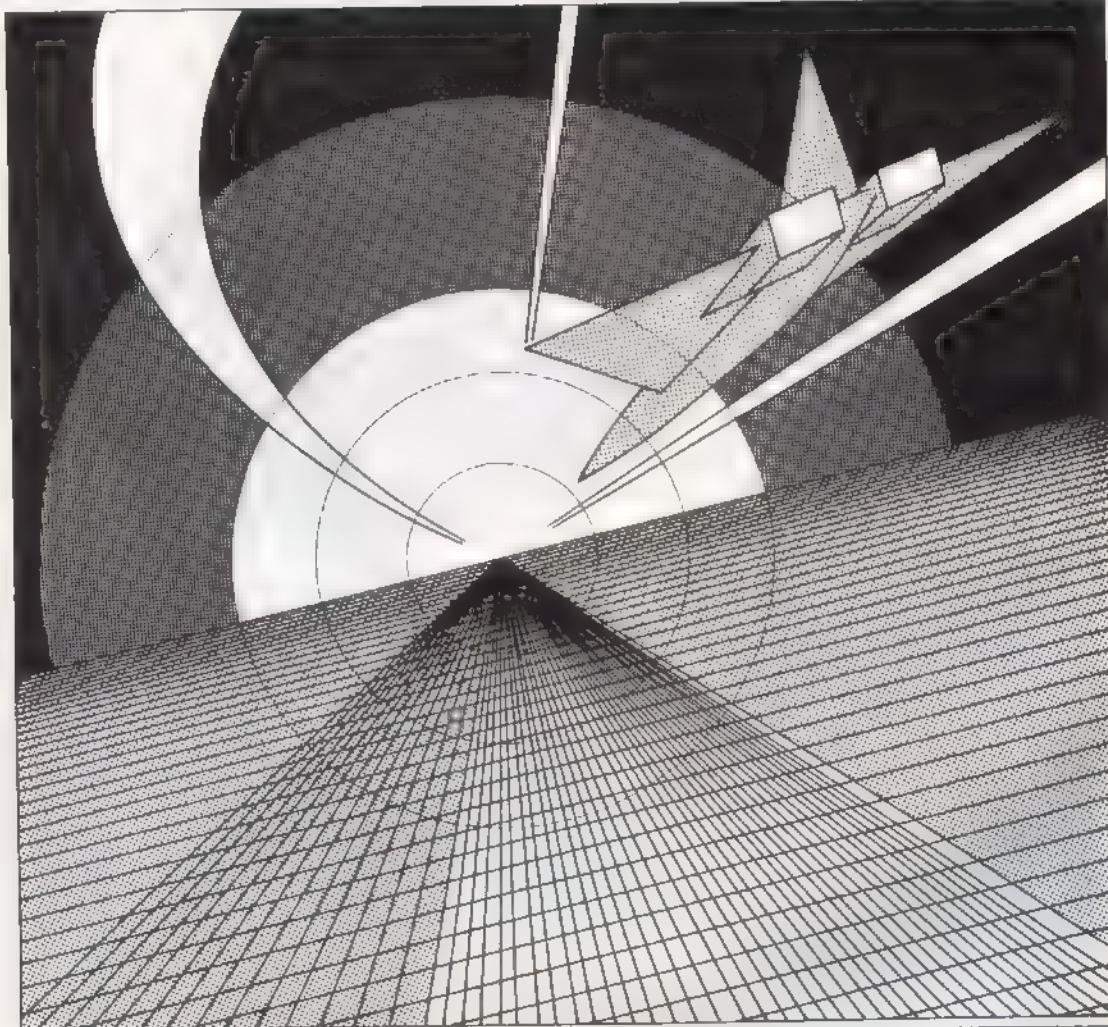

To enter the game, first enter the Basic program. Once you have done this, save it to tape using Save "Gravitar" Line 9999. Now type in the data for the character set using the hex loader. Save this using Save "Characters" Code 64000, 472.

When the game is run, the title page will appear. If this is left, the high score table and instructions will also be displayed. The object of the game is to go from planet to

planet destroying the bunkers and collecting the fuel with your tractor beam. Once all the bases have been bombed, you can leave the planet via the top of the screen.

If you crash you lose a ship, and the game ends when either all your ships are destroyed or you run out of fuel. You begin the game with three ships, and get an extra every 10000 points.

Happy shooting ...

The Mex Loader Program is a powerful and flexible software application designed to facilitate the loading and unloading of data from memory cards into a computer system. It is specifically designed for the Mex 1000 and Mex 2000 memory card readers, which are used to read data from various types of memory cards, including SD, MMC, and CF cards. The program provides a user-friendly interface for selecting the appropriate memory card and reading the data into the computer's memory. It also includes a feature for writing data back to the memory card, which is useful for transferring data between different devices. The Mex Loader Program is a valuable tool for anyone who needs to work with memory cards and their data.

Oric's IQ test

Christina Erskine talks to Bruce Everiss of Tansoft

Bruce Everiss reminds me of Mr Mincawber. He always turns up. His latest appearance has been in the role of managing director of Tansoft, the Cambridge-based company now owned by Oric directors Barry Muncaster and Paul Johnson. This follows a number of Bruce sightings, as both a computer journalist and Yamaha's representative for the CX5 micro, since the demise of Imagine where he was operations director.

Bruce was appointed a month ago, following the departure of former Tansoft directors Paul Kaufman, Cathie Burrell and Geoff Phillips.

His brief is not only to develop the software company, but to take charge of all Oric's marketing including three new machines due out early in the New Year. The successor to the Atmos, the IQ164, a portable model and an IBM PC compatible machine.

"To talk of three new machines from Oric is a little misleading," said Bruce. "The new one is really the PC-compatible series, for which we have designed the chips in-house — we have a chip set for the PC compatible that uses half the components normally used."

"Oric's PC will actually consist of two machines, similar to the two Advance models. The basic micro will have a

cassette interface and can be used as a home computer. However, we're looking at the possibility of waferdrives and quickdisks for data storage."

The quickdisc is being considered as a cheap alternative to microdrives or more conventional disc drives. The mechanism is extremely simple, the 3½ inch disc rotated by a single motor, the head moving across from edge to centre on a plastic peg. Each one has a capacity of 64K per side. According to Bruce, several Japanese companies are planning to introduce quickdisks for machines in the UK.

"With the IBM PC compatible version of the micro, we're looking at Winchesters and hard discs, of course."

The lap-held machine is not an Oric manufactured product, though Oric, through Barry Muncaster and Paul Johnson, have contributed to its design. "We also have a specific Local Area Network designed and ready to put into the machine," the machine is made by a US company and Oric is putting its name to it in the UK.

"This is definitely a machine aimed at the travelling company executive. You'll be able to load half a megabyte into Ram, it will have an 80 x 25 Hitachi screen display, so it's not aimed at the lower end of the market."

I wondered if it was being brought out deliberately before Sinclair launches its portable model. Bruce didn't seem to think Sinclair posed much of a problem.

"Sinclair's will be an inexpensive, simple machine — ours will be priced around £3000 and is a professional machine — after all, the display alone costs £1000 to put in. It's going to be more in line with the Data General 1.

"And as for the launch of the new products, it may not be as originally planned, now that I've come in to coordinate the marketing. Remember, I'm still in my first month at Tansoft."

We talked about the IQ 164, the forthcoming home micro and follow-up to the Atmos. "It will be a bigger machine

than the Atmos, and much more powerful. The Microsoft Basic has been extended to include commands for 3D graphics and sound. The Atmos will continue in the marketplace, where I see it in direct competition with, say, the Electron."

The IQ 164 contains custom ULA's to control video, Ram refresh, address decoding, memory paging, bus buffering and logic functions.

"The machine will have 64K Ram and while it has no internal Rom, there are two Rom cartridge slots on the upper right hand side of the keyboard for applications and language programs."

The language cartridge can contain up to 64K and the applications cartridge up to 48K. "A Basic cartridge will be bundled with the machine at launch, and logo will also be available."

The IQ 164 will be heavily pushed in the European market, where Oric has had far more success than in the UK. It is set for launch in France, as the Stratos, before the UK launch.

Before the launch of new products, Bruce's first job is to build up Tansoft. "I need to get together a first class team of staff here. Then, it's a case of expanding the software base."

"My policy is to establish a large catalogue of software, both for the Oric and other machines, and then add to that catalogue very selectively with quality products and delete the ones that aren't doing so well. Although Tansoft has not produced software for machines other than the Oric models so far, I am happy to convert to and from the Atmos if there is a demand."

"I've recently bought the entire catalogue from Voyager Software — most of which are fairly run-of-the-mill arcade games, but they've been modified and I'll use them all for Tansoft."

Bruce also had some interesting things to say about Oric manufacturing policies. "We're quite happy to let other companies test and define the market before we join in. If Sir Clive Sinclair gets a huge new market with the QL, then Oric will release its version of the machine. As the industry becomes more mature, we don't really want to take too many risks; we're more interested in making money."

These list the enhanced software features of the IQ 164 over the Oric Atmos

Amstrad Speech Synthesizer!

The dk'tronics Amstrad speech synthesizer and powerful stereo amplifier uses the popular SLO/256 speech chip and has an almost infinite vocabulary. It is supplied with a text to speech converter for ease of speech output creation. Everything you wish to be spoken is entered in normal English, without special control codes or characters, it is therefore extremely easy to use. The voicing of the words is completely user transparent and the computer can carry on its normal running of a program while the speech chip is talking. The speech output from SLO/256 is mono and directed to both speakers. To utilise the Amstrad stereo output on the back of the computer, the interface has a built in stereo amplifier, this gives all sound output a totally new dimension and greatly improves the sound quality and volume over the computer's internal speaker.

Although there are only 26 letters in the alphabet, letters have a totally different sound when used in different words. For example, The "a" in Hay is much longer and softer than in Hat. When you speak you automatically make adjustments because you know just how a word should sound. Not quite so easy with a computer. After looking at other speech synthesizers we decided that it was essential that the dk'tronics Amstrad Speech would offer a simple system that would enable the user to produce realistic speech that was instantly recognisable.

The solution to the problem was extremely complicated, it required hours of programming to enable the computer to look at the individual letters that make up each word and compare their relative position to each other before deciding on the appropriate sound.

I am delighted that we have now perfected what I consider to be the best Speech Synthesizer on the market, one which has achieved my aim, within the limitations of the allophones, of producing realistic speech.

At only £39.95 the dk'tronics Amstrad Speech Synthesizer represents remarkable value for money.

Available from department stores and good computer shops everywhere or direct from

Multi-tasking

Hardware The XP memory expansion system **Price** £15.95 **Supplier** TV Services, Chesterton Mill, French's Road, Cambridge.

A four megabyte, multi-tasking Spectrum? If you can afford the Ram, that's one of the possibilities presented by the XP expansion board, which gives the facility to add up to 128 extra pages of memory, each of 32K.

The XP system comes in two parts: the hardware has been developed by the ingenious Steven Adams, while Andy Penhill has written software that allows multi-tasking and windowing. For £15.95 you receive the software and a ready-built, three by one inch, circuit board which hosts five ICs, two resistors and a capacitor. Fourteen wires need to be connected between the PCB and the computer, some attaching to the board and others to IC pins. A certain amount of track cutting is also necessary.

Although the instructions are reasonably clear, installing the kit is not a job for beginners, particularly as there are at least four types of Spectrum circuit board. Sending your machine away to have the board fitted only costs £5 extra (plus postage), which must be the bargain of the month.

The chips are standard TTL items — NOR gates and flip-flops — and are arranged to react as an I/O port. Bit 1 of the I/O address is all that is used in the decoding process: the "official" address of the port is 253. There are three possible states that can be produced by writing data to the port. Any value over 127 allows external Ram pages to occupy the top 32K of address space. 126 will enable the normal upper 32K; 127 selects another 32K block of Ram already contained onboard the Spectrum, although this last block may not be complete, or not even work at all.

Confused? What extra 32K am I talking about? The 48K Spectrum has two groups of Ram chips. The addresses &H4000 to &H7FFF are serviced by a batch of 16K chips, while &H8000 upwards uses eight 32K bit ICs, which are in fact 65K bit chips that are faulty, with one or more duff bits in either the upper or lower half. Sort these into batches of "high" and "low" and you have a supply of 32K bit Ram chips.

These were not always available, so some Spectrums were fitted with perfect 64K chips, while others may have quite a lot of usable "alternative" Ram. The suggestion is that over half the machines fitted with the XP board have a decent amount of extra Ram.

The designer makes it clear that there are no guarantees; it is possible to fit 64K chips to ensure an additional internal bank of memory, but the main purpose of the XP

circuitry is to keep the internal Ram refreshed while external Ram packs are switched into place. The first pack available will contain two 32K banks and cost under £100, while technically-minded Spectrum owners will be able to convert existing 32K extension packs to suit the system.

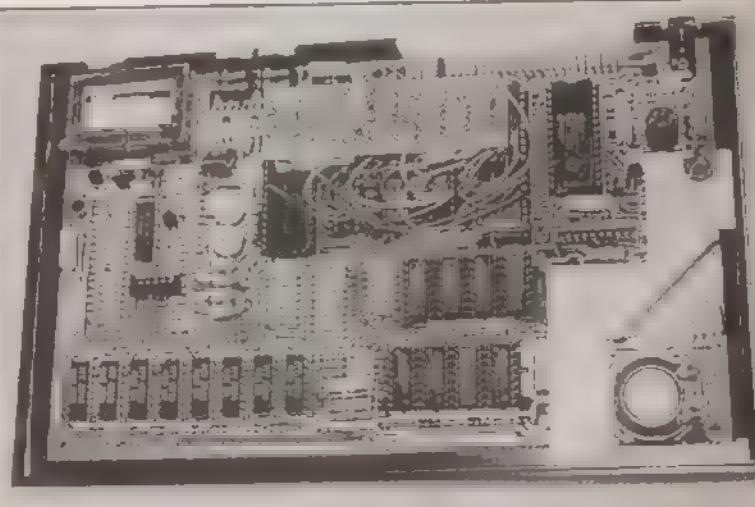

With the board fitted a Spectrum behaves just like any other, providing you leave I/O port 253 alone. So far, only one commercial program has been found to crash — one of the Ultimate games. To use extra banks, Ramtop must be lowered to &H7FFF, leaving you with a 16K Spectrum, otherwise switching off the normal page will cause Basic to lose its stack (a very sorry state of affairs).

You may be wondering how it is possible to benefit from the hardware; the answer lies in the software. This is supplied on cassette and loads into the non-switched Ram; it searches the external world for working pages and each one that it finds is set up so that it resembles the Basic program area. You are then placed in the home page, with almost 32K available for programs and a number of extra commands at your disposal. These normally take the

include that page as the next in the chain; you end the chain by giving the last page's number again. If you now run the first program all the programs in the chain will run. The software, running in interrupt mode 2, allows one program to run for a fixed period of time, followed by another, and so on. Certain operations pause the multi-tasking as they disable interrupts, such as Beep and cassette commands. Input, Save and error messages halt multi-tasking and it must be restarted. It's just as well that Input does — two input commands running at the same time would be rather awkward!

Windows are implemented with a command that has four parameters defining the top left corner of the window and its size. Sinclair Basic programs take these as the limits for character (but not graphic) output, each page having its own window. It can be argued that these are not "true" windows, as when they overlap neither covers up the other, and scrolling a large window will move the contents of any smaller windows within the area. The same argument applies to QL windows.

Passing variables between programs is

Spectrum fitted with XP memory expansion circuit board.

form of Randomize Usr statements, with any parameters following in a Print statement.

However, owners of an Interface 1 will find that extra command words have been created for their convenience. It is possible to switch to another page (even an unusable one). New the current page and stop a program running in another page.

The most interesting commands allow multi-tasking and windowing. Multi 0 or its Randomize equivalent clears the multi-tasking. Putting a Multi statement at the beginning of each page's program with a valid page number as a parameter will

make possible because there is space in the lower section of memory which can be accessed by any program. A planned enhancement to the system will also allow ROMs to be paged into memory.

To get two programs running concurrently on the Spectrum is quite an achievement; the possibility of getting 32K of additional Ram, at a price of £20.95 (or £18.95 if you fancy your chances with the kit) make this one of the most exciting additions to the Spectrum to date.

Jeff Naylor

HERE'S WHAT YOU'VE SAID...

"The standard of the programme is far, far better than we were expecting" **ALAN DAIRE**

"Eureka! is superb. It's marvellous to have computer software of such high standard from Ian Livingstone" **CAROLE SKAIFE**

"It's taken over my life - I only have three hours sleep a night. I hated adventure games before this but Eureka! is brilliant!" **ANONYMOUS CALLER**

"Congratulations on producing such an entertaining and stimulating package" **J. GOODENOUGH**

"I would like to thank all involved for making such an interesting game, especially the riddles" **NORMAN SCOTTER**

"Please, give me a clue to the £25,000"

CHARLES COOPER
(Sorry, Charles)

"I hate this game. I seem to be missing all my favourite TV shows" **ADAM BOWLES**. *(Poor old Adam)*

TELL US WHAT YOU THINK.

Safety in numbers

Which MSX? Jeff Naylor separates the peas from the pod

MSX certainly has its disadvantages. But it also has some good things going for it.

The current pricing structure for the Japanese micros is definitely a serious drawback but, that aside, the attractions of the system are considerable.

Using a Z80 CPU may be considered by some to be old hat, but there are plenty of programmers who can write software for it.

MSX may lack an 80-column display or very high resolution graphics, but the sprites that are available are easily manipulated from Basic to more than compensate the games programmer.

Extended Microsoft Basic may not have anything to offer the structured language enthusiast, but its sound and graphics commands, high-precision arithmetic and interrupt structures make it a powerful language.

Value for money? At present that is certainly questionable. The quality of many of the machines goes some way to justify their price — blame the rest on

a strong Yen. And, as long as you trust the companies to stick to their promises, the standardisation carrot is very attractive.

The MSX design standard is very well known now so I shan't go into much detail.

Nevertheless, if you have got as far as thinking that you want to buy an MSX machine, then there are still decisions to be made. Although the machines are very similar, small differences in specification and manufacture allow distinctions to be drawn; some users will find use for an RGB socket, for example, while people intending to spend a good deal of time hammering away at a keyboard should examine it with care. If a computer is to invade the living room, then with the choice available there is no need to buy one that is aesthetically offensive either to you or the other inhabitants.

Collecting seven computers together and making judgements on their relative merits does involve personal

opinions, particularly when they all share the same standard, so my comments concerning subjective matters such as styling and keyboards should be backed up with visits to computer stores.

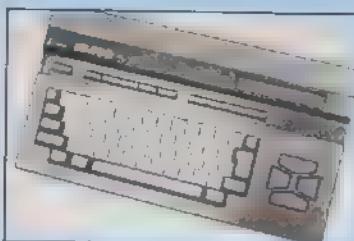

All the seven have 64K of Ram, on top of the 16K of video memory, but 32K machines have no less Ram available to Basic. To use the extra memory that lies under the Rom requires machine-code tricks, and I am not yet aware of any software that will not run on a 32K computer.

Neither the Yamaha nor Hitachi machines have been considered here. The Yamaha costs over £500 and comes with a music keyboard; the Hitachi is being sold as a portable business machine and is priced over £350.

Both are therefore pitched into slightly different areas of the market and cannot justifiably be compared directly with the other seven MSX micros.

Also, neither machine is likely to be available before next week.

Mitsubishi ML F80 — £299

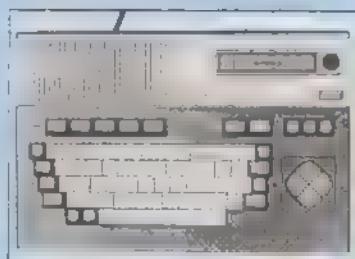

The styling of the Mitsubishi is in a decidedly high-tech vein — sleek and modern.

The keyboard has not succumbed to the design, however, being composed of normal keys the action of which is quite respectable. Layout is pretty standard: the return key is fairly large and well placed,

the shifts are of a good size, and the caps-lock has a built-in indicator light. It is the function, editing and cursor controls which are a victim of the designer trying to achieve looks rather than ergonomics. It is not their size and shape that is the problem, but their short action. Not quite as bad as some machines, maybe, but still poor.

Inside the ML F80, the standard of construction is quite respectable. The power supply is small and efficient and the usual separate Pal TV encoder board is evident. There are two Rom slots available, the one at the rear doubling as an expansion bus connector. Neither slot is guarded by a microswitch to cut off power when a cartridge is inserted, and the rear slot is rather wobbly. As would seem sensible, the slot on the top of the machine has priority over the rear port.

Goldstar FC 200 — £230

Price is this machine's most important feature, but to some extent this is unfortunately reflected in the quality of construction.

The FC 200 is very similar to the Toshiba TX-10 in terms of styling — simple and well proportioned, but the most obvious difference lies in keyboard. This is not too well laid out, with keys such as *Ctrl* and *Code* unusually placed. The return key is the worst example — not only is it too small, but is sited so high up that it is hard to find.

The shift keys also suffer from being a little too small. The keys have a rather dead feel to them. A problem exists with the lack of a pound symbol; there is one in the character set, but not engraved on any of the keys.

Inside, the impression that this computer was not built by a Japanese company — it is Korean — is perpetuated. Although perfectly acceptable, the printed-circuit board does not have that well-produced look of its Japanese counterparts. Instead of the single 32K Rom used by the other MSX computers, the Goldstar has two 16K Eproms, which at least gives it a higher scrap value!

Slightly perturbing is the use of insulating tape, rather than rubber sleeving, to shield the back of the mains switch.

The single Rom port is microswitch protected, and seemed stiff when inserting or trying to remove a cartridge. Alongside is the machine's 'special' feature — a hole proudly labelled 'Pen Holder'.

Goldstar is not a member of the UK MSX working party, and when it released the FC200 it caused a stir, being priced almost £50 less than its nearest Japanese rival.

will find the joystick sockets well placed on the front edge, and two unprotected Rom ports.

The side port doubles as the expansion socket and has priority of the top slot. This seems the wrong way round to me.

Sanyo MPC 100 — £299.95

Clothed in black and silver, with white legends on black keys, the styling of the Sanyo is simple and uncluttered. The layout and feel of the keyboard is very pleasant; I personally liked its Qwerty keys, and the special keys do not lag far behind: even the cursor keys are a good compromise between programming and

games use. The space bar is particularly wide, and the caps-lock key lights up.

Construction is to a high standard, but one rather nasty bodge spoils an otherwise well made printed-circuit board — this may be unique to the review machine, though. The standard video PCB found in other Japanese models goes one stage further and not only contains the modulator but also slots in place rather neatly. The power supply is lightweight. It is interesting to see

if rather pedantic — that the MPC 100 has a rated power consumption of 11 watts, whereas the Goldstar uses 20 and the Sony 24 watts. The Sanyo will run for 90 hours, rather than about 50, on six pence worth of electricity!

There is only one Rom port, protected by a microswitch, so the expansion bus is of a "non-standard" variety. A reset button is provided.

stop, as the effects of the stylist have left the machine with a decidedly plastic look which stems mainly from the design of the control keys. Lying in a flush line across the top of the main keyboard they are ugly and ungainly in operation.

The cursor keys are worse: virtually no travel makes them a pain to use, even for games, but they still rattle. The Qwerty keys are much better, but still not as good as other machines. Even the space bar is too short.

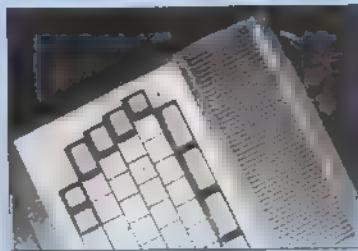

The reason for the Canon's weight (a large mains transformer) has counter-productive effects; hold down a shift key and you become aware of a gentle vibration running up your arm. I suppose it makes the 'Power On' LED indicator redundant! Apart from the sub-station sized transformer, the case houses a well produced PCB. Back outside the case, you

Canon V-20 — £280

The Canon is a solid computer that sits firmly and purposefully on a desk, housed in a black, rounded case. Unfortunately that is where the compliments

Toshiba HX-10 — £279.95

The HX-10 is pleasantly styled, with a nicely produced case. The keyboard is one of the best in terms of feel, while the layout produces no surprises. You could

Sony HB-75 — £299

The Sony is the most purposeful looking of the computers.

With the case being mainly black, it has an air of quality and substance, despite being plastic. The Qwerty keyboard leaves nothing to be desired — there are even pips on the F and J keys for touch typists — and the tactile qualities are first class. It is a bit unfortunate though that the function and

quibble about the size of the shift keys, and the cursor controls are rather tightly grouped for games use.

The standard Pal TV signal encoder board is evident inside the case, and the PCB is well made and neatly laid out. Quite a hefty mains transformer — giving the machine some substance — sits in the back left corner. The Toshiba has just one ROM slot, again protected by a switch, so the expansion bus is non-standard. I reviewed the HX-10 a few weeks ago, and referred to it as a typical MSX computer. Examining the other available machines reinforces this opinion — it is well made, with no special features.

editing keys are so small, with a short action. A reset switch is also placed on the top row and has a raised surround, but Mr Clunay still managed to hit it instead of back-space on one occasion. Cursor keys are well spaced but also suffer from a short throw.

Shielding is evident inside the machine, although not to the same standard as the JVC. The general quality of manufacture is very high, and a big mains transformer gives substance without vibrating. Two ROM ports are provided, with the one on top having priority, but neither are fitted with a microswitch; at least Sony have provided a warning sticker.

An RGB socket is fitted to the back of the machine. A further enhancement is a built-in ROM program that provides simple data handling — memos, addresses and so on, in the form of a filing system. This is menu driven and very easy to use. When powered up without anything in the ROM slots you are presented with a menu for the data program that also allows you to access BASIC.

JVC HC-7 — £279

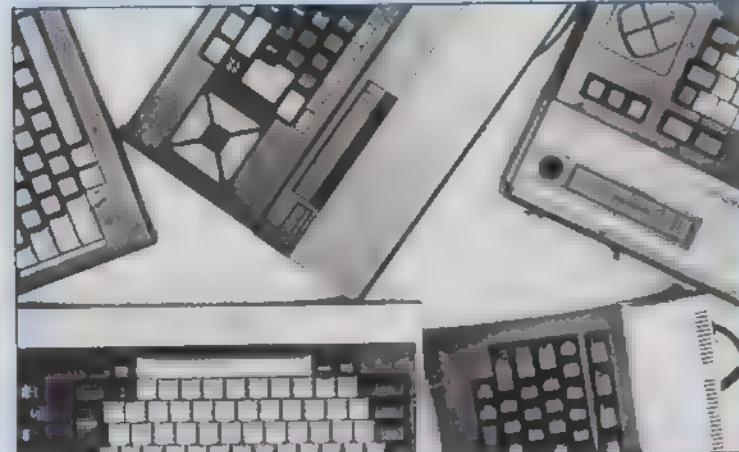

The designer of this computer was obviously told to produce something that looked futuristic.

The result looks like a hump-backed whale with the flight deck of the Starship Enterprise stuck on its back (which is not to say that it won't be to someone's taste). The keyboard has a rake and curve which may, or may not, help to speed up typing. Apart from this, the keys are well laid out and feel fine. The function and editing keys are very sensible, with Stop being placed out of harm's way.

The JVC is not just well made. Taking it apart is like breaking into Fort Knox. This computer has been built to meet US radio interference regulations so everything is shielded, from the power supply to the back of the keyboard. Because of the unusual styling, there is no ROM slot on top of the machine. One lurks in the back and the other, which has priority, is on the right-hand side. Both are protected by microswitches.

An additional connector is provided which supplies RGB signals, so connecting a monitor is possible, though the 40-column resolution of the MSX system is quite at home with an ordinary TV set.

The Verdict

Now to put my head on the block — for what it's worth, my personal assessment of the seven machines is:

- 1 Sony HB-75 £299
- 2 Sanyo MPC 100 £299.95
- 3 Toshiba HX-10 £279.95
- 4 Mitsubishi MI-F80 £299
- 5 JVC HC-7 £279
- 6 Goldstar FC 200 £230
- 7 Canon V-20 £280

I have assumed that the price factor is not as important as quality of construction — otherwise why buy an MSX — and so the Goldstar doesn't feature in the top five.

The Sanyo might have made it to first place if not for the Sony's built-in data handling program, while the JVC loses out because I personally didn't care for its styling. I offer no excuses for putting the Canon last — I just didn't like it as much. It didn't feel quite right.

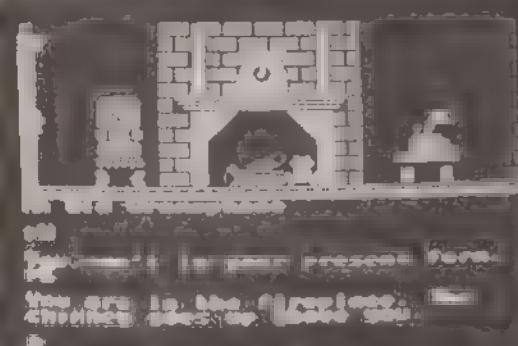

The only question remaining is, if Nissan bring out an MSX machine, will it have a cigar lighter as standard?

Lateral

Program *The Witch's Cauldron* Price £5.95 Micro Spectrum 48K Supplier Mikro-Gen, 44 The Broadway, Bracknell, Berks.

In my time as an adventurer I've been many things — brave warrior, magical elf, even Denis Thatcher, but to start life as a toad...

Of course I never wanted to be a toad, but that's what comes of messing with Witch Hazel. So I strive to cast spells which

will cause a series of metamorphoses until I am free of the body of Kennit's second cousin.

Now I'm a cat — not purrfect but I'm feline better. This form opens up more possibilities, too. However, I can't get through those small holes that I

could a minute ago. I should have planned ahead.

Planning ahead is an integral part of this graphic adventure, and you'll need to be capable of lateral thinking to the nth degree. It's tricky and witty, frustrating and fun. Responses are fast as you'd expect and there's a good keyboard 'Beep'.

Though the written descriptions are rather thin, each scene has a very satisfying illustration, with your figure placed in position — nice to see I was a handsome toad at least! The usual feeling of N-S-E-W location block construc-

tion isn't too strong either with many of the early stages set in single rooms.

A novel and highly entertaining adventure.

John Minson

playing the most advanced games on the computer and is in fact highly discerning when it comes to quality of programming.

Jerky, slow, dull and uninspired graphics are surely even

Accurate

Program *Number Painter* Price £8.95 Micro Amstrad CPC 464 Supplier ASK London House, 68 Upper Richmond Road, London SW15

The principal reasons for using a micro as an educational medium is that the programs can be tailored to react to the user in proportion to the rate of learning and also that the colourful graphics and attractive sound can be used as an 'attention grabber' and a 'reward' to encourage the child to keep on trying.

Unfortunately a lot of companies seem to fail to realise that your average 12 year old has almost inevitably spent hours

A myth

Program *Orpheus in the Underworld* Micro Commodore 64 Price £7.95 Supplier Sterling Software, Garfield House, 86/88 Edgeware Road, London W2.

The success of Activision's *Pitfall* has given rise to a number of imitators, most obviously Microdeal's *Cuthbert in the Jungle*.

Some of the same ideas have found their way into *Orpheus in the Underworld* from Sterling Software — but this time with a mythological setting.

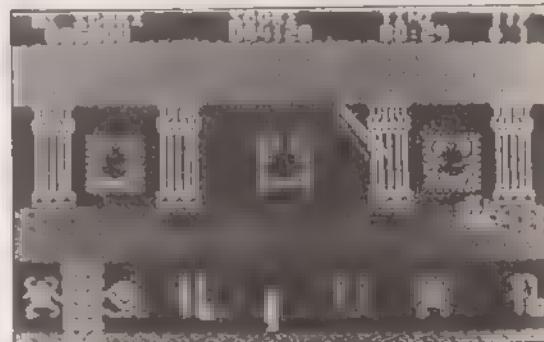

The format of the game is very much as before. The objective is to collect various jewels, treasure chestes and the

like which are distributed over 120 screens, while avoiding the hazards. These take the form of rolling boulders, tar pits, deadly multi-headed serpents, etc. Some of the tar pits have the nasty habit of opening up under your feet as you try to run across the screen.

Those of you familiar with the earlier games will recognize all of these features. The similarity continues — there are also some underground passages which contain more treasures and hazards.

If you enjoy the *Pitfall*-style game you will probably like this too — and the graphics are quite interesting. It's hardly very original though.

Richard Corfield

more off-putting than usual when burdened with the label of 'educational software'. Just as well then that ASK's programming and presentation is faultless. Fast and accurate mental arithmetic is tested against an arcade format somewhat similar to the *Panic*

computer game. You have a reasonably tight timespan within which to climb ladders up and down platforms collecting numbers which are used to divide, multiply, subtract and add together to reach a predetermined target number.

The lowest levels are encouragingly easy and should suit most five year-olds whilst the highest levels can be very hard indeed so there is a real progression in ability. To confirm this there is an enclosed self test routine to measure any improvement in your performance.

What makes it a winner also is the fact that the 'gameplay' is slick, challenging and enjoyable enough to make it a medicine that is very easy to swallow.

Tony Kendle

Detailed

Program *Battlecars* **Price** £1.95 **Micro Spectrum 48K**
Supplier Games Workshop, 27/29 Sunbeam Road, London NW10 6JP.

This is one of three releases from the people most usually associated with Fantasy Role Playing Games such as Dungeons and Dragons. Indeed, *Battlecars* is directly taken from a series of FRP's of the same name. It is, therefore, no surprise that the amount of thought that has gone into the actual gameplay is tremendous.

The documentation is very slick and reading the booklet gives an indication of the character and atmosphere that makes role playing games so popular.

On loading the game initial impressions are also favourable. The two cars, your's and a friend's, or your's and the computer's, are each given a display window showing their local surroundings from above. There is also a map of the whole playing area showing relative positions; it looks like Ultima's *Trans Am* with more detailed landscapes. Unfortunately, the similarity ends there. Of the three releases only *Battlecars* desperately needed to be a fast, smooth scrolling game — instead the cars creak along with slow character square movement which ruins everything.

You are given good value with over 90K of code split into sections such as a car designer module and three game settings. The first is a complex race circuit where you can challenge the clock, a friend or the computer. The second screen is an open combat arena, but the computer plays its part here too. The game really comes into its own as a two-player game and the last module, 'the city', is by far the most exciting.

Unfortunately, unless it is recorded, which would make it brilliant, the game will only appeal to the limited two-player market.

Tony Kendle

Tester

Program *Estimator Racer* **Price** £4.95 **Micro Spectrum 16K** **Supplier** Sinclair Research, Stanhope Road, Camberley, Surrey GU15 3PS

I've always been sceptical about 'educational arcade' programs. Often they're just a little maths tacked onto an

outdated shooting game. But Psion's reputation is outstanding, and with Applied Systems knowledge they've produced this mental arithmetic tester.

Estimator Racer is a simple Pole Position with sums. Steer your car across the four num-

bered lanes of the track choosing the one with the figure closest to the answer to the question below. Every half ki-

ometre you either continue if correct or stall, losing valuable time, if not.

To complicate things, the second section adds oil slicks which cause skids and jumble the lane numbers. Rocks then cause further stalls, while the night rally finale makes you cross all the lanes to illuminate their values.

I found this all genuinely exciting. Trying to calculate without having to decelerate while avoiding additional hazards keeps you thinking under pressure. In fact, recognising an approximate answer is often more valuable than producing a slower, more precise solution.

The program has four skill levels (faster cars, more difficult questions), a choice of sums, plus practice and demo modes. I can't praise it too highly and there are many adults who would enjoy and benefit from it.

John Minson

To scale

Program *Geography* **Environmental studies** **Micro Spectrum** **Price** £6.95 **Supplier** Soft-soft, 5 Minister Gardens, Newthorpe, Eastwood, Nottingham.

Too often the word 'educational' has been used as a way of conning the public or schools into buying software of little interest and even less educational value.

Not so with this package which combines four separate programs each containing a number of different activities.

The set of programs is ac-

companied with a booklet describing the programs and a suggested method of use is included for any poor teachers too exhausted to work out their own.

Quality has not been sacrificed for quantity — the modules are interesting and include a simulation using the spread of disease amongst trees as the model, a data base

Random

Program *QL Forth* **Price** £29.95 **Micro** (Version AH and above) **Supplier** Computer One, Science Park, Milton Road, Cambridge.

The first and most important fact about this version of the Forth language is that it is a full implementation of the Forth 83 standard and not the old Fig 79 standard version found on most computers.

This means that there are a great number of improvements

as well as the additions to make use of the QL's power and hardware.

Even with the limitations of the microdrives, this version allows random access files as well as sequential files to be used. You may also multi-task up to ten other Forth programs while running one main program. To go with the Forth there are two software overlays — the first is a powerful editor and the second is a Forth dictionary. These are overlays as the system works within 64K of which 20K is

program containing information about all the major countries of the world and two games. Both of these set clear objectives and utilise skills of map reading, using scale, making decisions, etc, in the search for fun (and learning).

All the programs are based on good ideas, fast efficient programming, lively colourful presentation and achieve sensible educational goals.

On the cover it says "approved by teachers". It should have said "approved by kids" as well.

Chris Stoneham

taken up by the Forth itself, so leaving 44K for programs. This memory limitation is no real problem as few people write programs over 44K in length.

The manual supplied is most useful and gives all the information on the additions that have been made to the version Forth. Of the 70 pages, 40 cover the 'Word' set while the rest deals with using the editor and assembler.

Roger Thomas

Overtime

Program Payroll Plus 64 Price £97.75 Micro Commodore with disc drive Supplier Landsoft

Landsoft, a company primarily concerned with specialised business packages, has produced a payroll package for the Commodore 64. In common with all pre-programmed payroll packages it conforms with the Inland Revenue requirements for computerised payroll records.

While most software support for the C64 has been fairly and squarely in the games arena, a number of companies do produce business material for the 64 and it is a simple task to build a full accounting system. Operating a business on a 64 system — ie, micro, disc drive and printer — requires a considerable amount of manual dexterity. To accommodate all the necessary functions a library of pre-programmed and file discs must be manipulated. A double disc drive eases matters but does not eradicate the problem.

Once the difficulties of tending to the disc library had been overcome and the payroll package loaded, the program proved to be neat and reliable.

Ice-flow

Program The Perils of Percival Penguin Price £6.95-£8.00 Micro BBC B Supplier Willowsoft, The Willows, Wrington Lane, Congresbury, Bristol.

Payroll 64 is menu-driven and passworded to ensure security. The first stage is to input basic employee information. This is drawn from normal P45 information plus departmental status, etc, not unlike the employee record cards in a manual system.

The employee files allow for pre-set adjustments — two pre-tax and two after tax. At any point of payment a further three pre and after tax adjustments are made available. Three overtime rates can be shown and pre-set. It is highly unlikely, however, that in a small operation these facilities would be fully utilised.

The employee may be shown as hourly, weekly or monthly — in the first two cases the rate must be input per week or hour. In the last case the annual salary is sufficient and the program will make the splits for you at the point of payment.

As each payment period ends, information on overtime worked and any adjustments are easily added, the program automatically updates the files and a payslip can be produced. The payslips are printed in duplicate side by side, so perforated paper is a must. Payslip printouts can be obtained after each employee entry, by selection, or as a continuous run. Up to 100 employees can be administered.

After each entry sequence

(weekly/monthly) an analysis of pay, national insurance, tax etc, is available. It is easily understood and provides a suitable basis for nominal postings. Information for the purposes of completing form P35 is readily accessible and the end of tax year routine is a simple operation.

The program does not cater for statutory sick pay rules which could prove problematic, though, to be fair, programs covering this subject are cumbersome and difficult to manage.

On the whole, I found the program simple and accurate, but I cannot help wondering where its intended user base is. Small businesses running solely a Commodore 64 cannot be thick on the ground.

One can imagine a new company using a C64 already in one executive's possession, or the case of a business wishing to hold its payroll information totally separate to its main accounting function. In this case, it seems a reasonable buy.

At £97.75, the price is a little on the high side. A facility is also given for an update service at £23 per annum — a necessary addition to cope with the vagaries of the Inland Revenue.

Robert Weir

tated by radiation.

To maintain energy you must eat the fish dropped by your mate on her way back from the sea to relieve you. You'll need that energy! Each screen must be completed within a day or lose a life.

The graphics are good and the action quite smooth. There is a musical accompaniment which you can turn up or down from the keyboard. Michael Legg is credited with the game and he's done a fine job. The cassette liner includes plenty of helpful hints on how to tackle each stage of the game.

There are similarities to the *Manic Miner* school of games but this is more ecologically sound!

Dave Watterson

Thermal

Program Doomsday's Revenge Price £9.95 Micro Spectrum 48K Supplier Beyond, Competition House, Farnden Road, Market Harborough, Leicestershire

In *Lords of Midnight* Beyond hit upon a highly inventive approach to strategy games. Using a technique they called 'landscaping' and a vast number of single key press commands they let the player view the landscape through the eyes of various allied characters as they massed armies and recruited new warriors.

Fans of the *Lords*, and there are many, will already have packed their thermal vests to venture north to rescue Morkin, son of Luxor, who is held by Shareth the Heartstealer. Actually this is the least of the quibbles, for Tarithel, Morkin's lover, also rides north, and is in need of help herself, and if Shareth can only be beaten then peace may finally reign.

This has added complexity, but thankfully the clarity of the instructions and a handy overlay keep things in hand. The quest is saved from being a mere exercise in button pushing by the accompanying history that leads up to the events, and gives them an epic feel. When I sadly lost Tarithel I actually mourned her heroic passing.

Every byte of the Spectrum has been used, resulting in the absence of a reset routine to return to the start. This unfortunate omission is rectified by saving the game early, so you can reload if all else fails.

In the time available, this review cannot begin to do *Doomsday's Revenge* justice. All I can say is that I'm hooked and can't wait to return to it.

Bytes get munched

The mystery of the missing Ram passed to QL users
by David Nowotnik

In the section marked *Odos* in the concepts part of the QL manual you'll find a memory map of the QL, and the main system variables which define where in Ram various items are stored. The addresses of these variables (in the *JM* version, at least) are those shown below:

SV Heap	163844
SV Free	163853
SV Basic	163856
SV_Tnsp	163860
Sv_Respr	163868
SV_Ramt	163873

These variables take up four bytes each, that is, to obtain their value, you have to *Peek L*; ie, *Print Peek L (163856)* will give you the start address of the Basic storage area in Ram. Taking the difference between values of variables will give you the amount of space taken up by different systems within Ram.

For example (1) *Peek L (163860)* — *Peek L (163856)* gives you the amount of space taken up by the Basic program (excluding procedures and functions, which are stored in the procedures area). (2) *Peek L (163856)* — *Peek L (163853)* provides the amount of unallocated Ram.

By playing around with these systems variables, you can start to find out how a lot of space is wasted in Ram, and some bugs that exist in QL's final Rom, the *JM* version.

When you first power-up the QL (or press reset), and print the result of expression 1 (the size of Basic), you get 4096 bytes -- yet no program exists in this area! I loaded a program which I calculated to be about 14K bytes long (it occupied 33 sectors on a microdrive cartridge; assuming 95K per cartridge and 221 sectors, this makes 33 sectors = 14K). Printing expression 1 (as a direct command) after loading gives 26624 bytes; almost twice the space is allocated to this program than should be required.

Try renumbering a program, and you'll find even more space is gobbled up than originally used by the program.

Here's another quirk; try program one.

Run the program immediately after loading or typing into your QL. *x* is given the value of the *SV Basic* system variable, the start of Basic, and is printed on the screen on each circuit of the loop. I found that after every 11 circuits of the *Repeat* loop the value of *x* dropped by 512 bytes; that is, for some unknown reason, more space was being allocated to *Basic*. Eventually, I got an out of memory error message — for a nine line Basic program! Not only that, but the computer failed to respond to any direct command (even *New*), and I had to press *Reset* (awfully useful that button!) to regain

control.

Even stranger was the fact that if I stopped the program by pressing space, then re-run the program, the variable *x* changed only occasionally in value.

The program I gave here is not just a curiosity; a friend recently used his QL at a swimming meeting to provide an instant results service. To everyone's annoyance,

the program crashed out with an 'out of memory' message, and the results service became far from instant. We found the fault to be when opening a channel to *Ser1* (the printer). Every so often, *Open* (or use of the channel) caused *SV Basic* to drop, so eventually he ran out of memory.

90K plus of user Ram on the QL may sound vast compared with most other home micros. But, the QL seems to waste a great deal of that space, and lose a lot through very serious errors in Rom. The *JM* version of Rom has been described as the final version — I hope not, for it seems the QL will be useless with many long Basic programs if they are destined to crash out from the bugs in Rom.

Program one

```
5 t=3
10 REPeat loop
20 x=PEEK_L(163856)
30 OPEN ft,ser1
40 PRINT x
50 CLOSE ft
60 t=t+1
65 IF INKEY$(0)="""
THEN EXIT loop
70 END REP loop
```

■ diamond can also claim his or her share of the Royalty Fund.

■ This grows with every copy sold up to ■ maximum of £1 million.

■ The Spirit of the Stones book is a great read.

■ The Spirit of the Stones software is great entertainment.

■ But they're much more than that.

■ They're an adventure.

■ A fascinating tale of mystery and imagination.

■ A voyage of discovery on the Isle of Wight.

■ A voyage of discovery

STONES HIDDEN ON THE ISLE OF WIGHT.

■ There are 41 of them.

■ 41 real diamonds hidden somewhere on the island, just waiting to be discovered.

■ 40 diamonds set in stoneware talismans. And the great Wight Eye itself, the most fabulous diamond of them all.

■ Only one man knows where they are hidden, and he's not saying.

■ All that he has to say he's said already. In the Spirit of the Stones.

■ It's a book and a computer game.

■ And together they reveal the whereabouts of all those diamonds.

■ But — and here's the catch...in the form of riddles and clues.

■ Solve the puzzles in the program and you'll find it easier to solve the puzzles in the book.

■ Solve the puzzles in the book and one (or more) diamonds can be yours.

■ Forever. And ever.

■ You don't even have to go to the Isle of Wight. (Though should you want to, we've put a bargain holiday offer in every pack).

■ You simply work out where the diamonds are, and post off your claim.

■ Whoever discovers

into an unknown world of poltergeists, unholy spirits, banshees, manticores and demons.

■ The Spirit of the Stones is as entertaining as it can be rewarding. And, like all of our software, it has been specifically designed to get the best out of Commodore hardware.

■ You can't choose better. Commodore software: it costs no more, even though there's more to it.

BOURNE HOUSE!

MSX Games Book. Easy-to-enter program listings turn your MSX computer into an arcade of electronic fun and thrills. Games test your reflexes, nerve, logic, strategy and intelligence! This book will open the door for all MSX owners to a fascinating new dimension of computer game action and excitement.

The Complete MSX Programmers Guide is invaluable for all MSX users from novice to advanced. It's four sections are a comprehensive self-paced guide for the beginner; a section devoted to advanced programming techniques; a detailed explanation of both BASIC and machine language, and a complete guide to the MSX Operating System.

The Complete MSX Programmers Guide is the reference book that will answer all your questions.

Supercharge Your Commodore 64 gives your Commodore the power of machine language. Without any additional effort, you can overcome the limitations of BASIC. Not only will your programs look better, run faster, and have more spectacular graphics and sound, but you will also be able to develop them in a fraction of the time. Whether you are a beginner or an experienced programmer, Supercharge Your Commodore 64 is a book you cannot be without.

Guide to BBC ROMs. At last a reference book providing 'at-a-glance' pictures of the fundamental concepts of the BBC ROMs. It lists the entry address of each ROM routine, and summarises each aspect of its function.

Guide to BBC ROMs gives you an overall view of your BBC microcomputer, showing you where to find everything you need.

It is readily applicable to all other versions of the BBC microcomputer and its ROMs - a valuable aid to all owners of BBC microcomputers.

Quick QL Machine Language explains how the 68000 instruction set and addressing modes work, and provides you with a full listing of an assembler and disassembler. In this process, the relevant features of SuperBASIC and QDOS are highlighted. This information, coupled with a line explanation of the disassembler, arms you with all the knowledge you need to produce your own assembly language programs.

Light Fantastic

This week a sneak preview of Llamasoft's latest program — Psychedelia — written and conceived by Jeff Minter

Jeff Minter's new program Psychedelia is going to come as something of a surprise to those expecting another fast-blast action game. In an industry that uses phrases such as 'innovative', 'unique', and 'totally original', with the abandon usually reserved for confetti at weddings, he has produced something that actually is a little different.

Jeff calls it a Light Synthesiser, and that is a fair enough description. If you've ever been to a laser light show you may find it easier to visualise if you imagine yourself at the controls of one of those machines. Listen

to your favourite track on your stereo while you create a kaleidoscope of swirling and changing colours on your TV. This roughly speaking is what Psychedelia is all about.

The concept is quite simple. You control an on-screen cursor with a joystick. On pressing Fire, a particular shape is plotted, 'decaying' eventually back to black, through different colours with time. If the joystick is moved while the fire button is held down, the shape is continually replotted, leaving a trail of changing colour.

It is difficult to do the program justice in words, so this week we present a short

version of Jeff's original idea that sparked the whole thing off.

We emphasise, this is just a taster of the main program. Psychedelia itself is considerably more complex with many pre-set shapes. It allows you to create your own. You can change the colour decay sequence of the 'trail', as well as its band width and pulse length. Stored sequences can be recalled on-screen and used as a background for more real-time creations.

However, the full-blown Psychedelia program will not be available (versions for the C64, C16 and Vic 20) from Llamasoft until December, price £7.99 for the 64, £5.00 for the others.

Until then, type in the Basic listing (paying special note to Lines 30 and 40 before you start), plug in the joystick, turn up your hi-fi and play that TV ...

Put to the test

It's never too early to start revising for those exams with Biology Quiz for the BBC B by Simon Pithers

This program tests the user to CSE & GCE levels, and contains 22 sample questions, although in a school environment a very much larger number of questions could be built up.

There is enough memory left in Mode 7 for another 180 long questions; alternatively

enough room for 250-300 small to medium sized ones (this refers to questions put in the data form as in the program).

If an even larger catalogue of questions was required, then a disc database could quite easily be added to the program. A disc with 100K would give about 1300

questions. Therefore, a double-sided double density 80 track dual system would give a staggering 19200 large questions, which should satisfy any Biology department! If adding more data, then change Line 170 to the new amount of questions.

This is the way the data is set out:

"Question"

"1st Choice", "2nd Choice", "3rd Choice".

"4th Choice"

"Real Answer A, B, C, D", "revision topic"

When the computer suggests revision topics, it puts itself into page mode, so press Shift to scroll the screen upwards.

Looking for a line

Get searching with this new instrng function for any Spectrum by Roy Whittle

This is a machine code program which provides an *Insetring* function for the Sinclair Spectrum.

When searching data stored in strings, I find the most useful function in both BBC Basic and QL SuperBasic is the *Instring* function, a function sadly lacking on the Spectrum. The *Instring* function searches for the occurrence of a short string in that of a longer string of text, or numbers, etc.

This short machine code routine will provide this function for the Spectrum. The code is relocatable and can be loaded anywhere in memory. This means that it can be used on both 16K and 48K Spectrums.

The function is added by using the Spectrum's ability for the user to define his own functions using *DefFn* but instead of writing a basic function, a machine code routine is called. In this way parameters can be passed to the machine code without having to move them into special memory locations.

The parameters can be passed in this way because when a user defined function is called, any variables the function uses are pointed to by the system variable `Defdata` (Chapter 28 in the Spectrum manual). By looking at this area of memory the parameter values can be read.

In this example the *InsertString* function can be used to insert a string into another string.

be added as follows—

Def. Eq. 1 (aS, bS) = 0.75 6000

When the function is called by a line such as— **39 Print Fn ; ("ab", "cab")**, the workspace is set up in the following way.

四三

From this information about the string to be searched (b\$), the string to search for (a\$), can easily be found.

£1.25

Do you want to expand your mind

or lose weight?

Home computing isn't all fun and games. The Mirrorsoft Home Discovery series of software programs can help broaden your knowledge and experience or even assist you to lose weight.

KNOW YOUR OWN PSI-0

How strong are your Psi powers? This intriguing and comprehensive package, by Prof Hans Eysenck and Carl Sargent is based on their book published by Michael Joseph. It checks for any helps develop latent Psi ability in individuals or groups. Individuals - notably clairvoyance, recognition of hidden objects or symbols, and precognition, foretelling future events.

On cassette for the CBM64, Spectrum 48K, BBC B, Electron. £9.95

KNOW YOUR OWN PERSONALITY

A fascinating way to get through to the 'real' you. Devised by Prof Hans Eysenck and Dr Glenn Wilson from their Pelican book of the same name. You'll get a clearer insight into yourself, and others too.

On cassette for the Spectrum 48K, BBC B, Electron. £9.95

STAR SEEKER

Published in association with the London Planetarium. This set of programs, written by Dr. Paul Phillips FRAS brings the magic of the heavens into your home.

Star Seeker accurately plots the most prominent stars from any position on Earth, at any time in this or the next century. You can obtain information on individual stars, and draw constellations. Solar System plots Planets and Halley's Comet, with us next year!

On cassette for the BBC B (Spectrum 48K and CBM64 versions coming soon) £9.95

MASTERMIND

Adapted from the well known BBC TV quiz game, this program lets you take the chair for general knowledge and special subject questions. It comes with two sets of each. Up to four players. Further low-cost packs of questions coming soon.

On cassette for the Spectrum 48K, BBC B, Electron. £9.95

THE JOFFE PLAN

A 'no-diet' personal weight control program. Prof Joffe's Plan awards credits or penalties based on progress to a target weight agreed between the user and the computer. Food is the best reward for an over-eater. So credits earned allow you to indulge a favourite dish. Penalties mean less food, more exercise.

On cassette for the CBM64, Spectrum 48K, BBC B, Electron. £9.95

Also available: Mastermind QUIZMASTER - Set your own questions to run on the Mastermind program. On cassette for the Spectrum 48K, BBC B, Electron. £5.95

A new image

Two new graphics commands for the CPC 464
by Brian Cadge

The graphics potential of the CPC464 is very promising, as can be seen from some of the first software to become available. However, in Basic the user is restricted to using user designed characters. The disadvantages of these are their size and the fact that only two colours can be present in each cell. To get more colours we have to individually plot the points using *Plot* and *Draw*. This is clearly too slow for fast action games.

Fortunately, it is quite simple to extend the Locomotive Basic (or any other language for that matter), using Resident System Extensions (RSX's). The program presented here gives you two new graphics

commands. Firstly, here is an explanation of how to use the new commands from Basic.

All RSX commands start with the *i* character (obtained using shift and @ together), and these commands are called *Define* and *Place*. Their syntax is:

i DEFINE, *image*, *width*, *height*

i PLACE, *image*, *xpos*, *ypos*

Notice that a comma appears straight after the command name and before the first parameter. This is essential, as is the *i* character; if either is missed out then you'll get a syntax error.

The first parameter in both commands is *image* which is a number referring to the particular image you wish to address. The

first *image* is numbered 0, the next 1 and so on. The more *images* you want the more memory you must reserve. As set up by the Basic loader you get space for two images, numbered 0 and 1. For every extra *image* you must lower *HMem* by 256 bytes.

Width is the width of the image in screen bytes (not in characters or pixels), there are always 80 column bytes on the screen, and so in *Mode 2* one character is one byte wide, in *Mode 1* a character is two bytes wide, and in *Mode 8* it is four bytes wide. *Height* is the height of the image in characters. The maximum size of an image is 7 x 4. This command assumes that the image to be stored is located in the top left of the screen. Therefore, you set up your character using *Plot* etc, and then use *i* *define* to get it off the screen. So in mode 1, to copy the equivalent of one character cell you would use: *i* DEFINE, 0, 2, 1.

(continued next week)

LINKWORD

FRENCH GERMAN SPANISH ITALIAN

"A quick way of learning - quicker
than the printed page".
Mike McCann, Your Computer.

"It took 12 hours to teach a regime that
would normally take 40 hours".

Peter Marsh, Training Manager,
Thomson Holidays.

"Vivid mental images are used as
unforgettable memory joggers".
Jane Bird, Sunday Times.

"Before you know it, you are
constructing your own sentences".
Mike McCann, Your Computer.

"We found the course great fun and at
the end a surprisingly large amount
had sunk in".
Whitel Micro

"Even a confirmed look - out of the
window like I found
concentrating on the course very
easy".
Sally Clark, Computer Choice

"Undoubtedly the Linkword cassettes
are the most interesting, most
enjoyable... of those considered".
Mike Chambers, Next

"The vocabulary sticks in your mind
effortlessly".
Sally Clark, Computer Choice

"An outstanding success".
Personal Computer World

HISOFT ULTRAKIT £9.45

The most powerful toolkit yet for ZX BASIC. All the features you will ever need: AUTO insert, full RENUMBER, block DELETE, CLOCK, ALARM, error trapping, break trapping, Full TRACE with single-step and much, much more. Makes ZX BASIC easy-to-use and powerful.

DEVPAC £14

An excellent assembler, an advanced line-editor, a comprehensive disassembler and a superb 'front panel' debugger all in one package. Used by many leading software houses to write their games. "Buy it!" Adam Denning 1984.

PASCAL £25

A powerful and almost full implementation of Pascal - not a Tiny Pascal. A valuable educational and development tool, programs typically run 40 times faster than a BASIC equivalent. Spectrum version includes Turtle Graphics package. "I haven't seen any other compiler that could match Hisoft's Pascal."

All prices, UK delivered, relate to 48K ZX Spectrum versions.

HISOFT presents FONT 464 for the AMSTRAD CPC 464

FONT 464 is a font designer and character generator especially developed for the CPC 464 microcomputer.

Design your own character fonts and graphic symbols with this very friendly and powerful package.

FONT 464 allows you to create a new design or amend an existing one using set, reset, invert, reflect, rotate, inverse and even animation!

Load and save character sets to/from tape, use the new character(s) from BASIC, design your own animated graphics - all this and more with **FONT 464**.

FONT 464 is supplied with three interesting and amusing character sets for you to experiment with.

★ All this power for: £7.95 inclusive ★

We also have available for the Amstrad CPC 464:

Hisoft Devpac - our full Z80 assembler and disassembler/ debugger with more features than you'll ever need.

Hisoft Pascal - a virtually full implementation of Standard Pascal. Compiles and executes incredibly quickly.

Please write to Hisoft for more details of Pascal and Devpac on the CPC 464 or contact Amsoft with your order.

notes all at the same time).

At the press of a button, you can summon up pre-programmed rhythms and bass accompaniments to play along to.

These three rhythm combinations can be speeded up or slowed down.

You can even glissando (so long as you don't hurt yourself.)

That is, make a note slide up in pitch.

You can filter sound: reduce the treble, the bass, or both. You can save, on cassette or disk, a voice or tune for future use.

And, for better sound reproduction, you can connect

MAKE MUSIC YOUR FORTE.

Alright, let's all gather round the computer for a good old sing-song.

You'll find the new Commodore 64 Music Maker strikes exactly the right note, whether you're an accomplished musician or whether you are an out-and-out beginner.

If you can hum and know your ABC, you can start to play famous popular tunes immediately.

No matter if you've never played a note before.

Simply type in the notes from the SFX Tutor Handbook,

then tap in the rhythm.

And, before you can even say 'Richard Clayderman', the automatic playback fills the room with music.

Once you've become a 'piano' virtuoso, you'll quickly appreciate the Music Maker's other amazing capabilities.

You can synthesize musical instruments, even create your own 'synth' electronic sounds.

You can play notes polyphonically.

(This is the smart way of saying you can play three different

Music Maker to your hi-fi system.

Music Maker has been designed, like all our software, to get the very best out of Commodore hardware.

It's the first in a series of packages which will fully exploit the Commodore 64's outstanding musical capabilities.

Commodore software: it costs no more, even though there's more to it.

MUSIC MAKER DISK CASSETTE £29.95.

Open Forum

We are always actively seeking programs for publication — either for Open Forum, the machine pages or Star Game. When sending in a program for consideration, a clear program listing should be sent, together with, wherever possible, a saved copy on cassette. Documentation — usually not more than 1000 words — should start with a general description of the program, what it does, and then some detail of how the program itself is constructed. We pay very competitive rates, according to the length and nature of the program and the quality of the accompanying documentation.

Hex Converter

on Amstrad

```

Arcade Avenue

On the Amstrad

I was very pleased to receive the first couple of letters in the column from Amstrad owners. The first is from James Marshall of unknown abode who has written about the game *Roland on the Ropes* adapted from the Spectrum Quicksilver release *Fred*. "For those who are disenchanted with the game due to the enormous amount of inhabitants dwelling in the tombs, can I say don't give up. On getting out of the fourth level, and every screen from then on, you are given the opportunity to select the number of ghosts, mummies and skeletons, etc that appear which is much better than leaving it to the computer. Also the speed of

the game greatly increases and the mazes become more complex. In fact I would say that the game really begins after level 4. I have managed to complete 37 levels and my score has completely turned the clock. PS. Keep up the great work — this mag really interacts with the readers."

Richard Couchman of St. Ives writes about Amsoft's *Harrier Attack*. "I was at first very disappointed as the graphics were the same as the Spectrum version and still flickery. The sound was better but didn't use the machine's facilities to the full. But after a few games I made it back to the ship and found that it actually allows you to take off again."

Thanks to both of you for your comments and I look forward to hearing more about this machine. So much Amstrad software is a conversion of Spectrum games, presumably because the authors are most familiar with Z80 code, but keep an eye out for Amiga's games as they seem to be one

of the very few companies converting Commodore games to the machine even though the 464 has similar facilities.

I was also very pleased to hear from N.J. MacArthur of the Isle of Tiree in Scotland who writes about *Chuckie Egg*. "I would highly recommend this to any Dragon owner — it is very enjoyable even though it does not get faster after level 10 making it lose a bit of its competitive edge. Having read of a score of over one million in a recent PCW, I set out to beat this and after 7½ hours of continuous play I had to give up with a record score of 4,081,790 on level 208 with over 100 lives left." Well how do you beat that? I think it proves the quality of the game — many games I see can't retain my interest for even seven minutes.

Two people have written in response to B.P. Jay's score on *Full Throttle*. Mark Gill of Leeds has completed 7 circuits on 4 lap races and Silverstone, Italy and Yugoslavia in 3 laps. His tip is to accelerate all the

time and skid off the track to pass other bikes. Stuart Young has finished all 10 circuits on 2 laps by the 17th August after having the game for only 11 days. "The way to succeed is to stay at the edge of the track and the outside of bends to avoid crashes." This arcade wizard has also scored 64,250 on *Pole Position* and 10030 on *Stop the Express* which beats the 6400 scored by Colin Johnson of Bishop Auckland in County Durham. Colin has, however, achieved the huge score of 258800 and 95% on *Sabre Wulf* even though he had only found 3 pieces of the Amulets!

Tony Kendle

The Arcade Corner is a new section for anyone who enjoys playing arcade games. If you have any comments, from playing tips on difficult games or programs you'd particularly like to praise (or blame!) then write to: Tony Kendle, Arcade Avenue, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

The Music Box

Digital sample

News from Autographics, makers of the Microsound add-on keyboard for the Commodore 64. The eagle-eyed among you may have noticed the company advertising a new version of their keyboard. As I write, this is not yet available. However, if the new keyboard is everything it promises to be, then you would be wise to get in the queue.

The original Microsound received very good reviews when it first came out. Now, Glyn Williams of Autographics tells me, the music keyboard has been improved in appearance and performance and the hardware and software to

add comprehensive digital sampling is having the finishing touches put to it.

Digital sampling is all the rage at the moment. In essence, the technique is a way round the problems of digitising the signals from an analogue musical instrument (as dealt with in an earlier column). Instead of having to convert a whole piece of music into digital form for storing and processing in your computer, a sampler takes a typical note (in fact, any sound at all can be used), converts it into digital form and then uses the data from this conversion to produce an entire range of notes from a musical keyboard.

Professional digital samplers have been widely used in the music business for two or three years now, the best-known device being the Fairlight CMI 'music computer'. But the Fairlight and similar devices retail for the price of a small house or flat.

The price of the new Microsound (£195 for the keyboard

and software plus £295 for the digital sampler and software) make it potentially one of the most exciting computer music developments around. A complete package from scratch — including computer, disk drive, monitor and Microsound — would set you back about £1000.

Glyn Williams tells me that, along with standard sampling features, the new Microsound will feature MIDI, modulation of sampled sounds using the 64's SID chip and a split keyboard enabling you to play two different instrumental sounds at once. Impressive.

At present, everyone is rushing to buy the DS3 sampler from Greengate, a company formed by the experimental band Mainframe and some computer-wise friends. The DS3 is designed for an Apple IIe (or equivalent) system and costs £490 plus VAT, including hardware, software and a small music keyboard (but without the Apple gear). A complete system sells for £1400.

I must say that the Microsound turns out to be half as good as the DS3. Autographics will be on to a winner. To hear what digital sound sampling can do — with no outside assistance — look out for Mainframe's 12-inch record, *Into Trouble with the Noise of Art* (on the YYY label). You can write to Greengate at 11 Milsden Drive, Hemel Hempstead, Herts HP3 8QR (tel: 0442 3486) and Autographics at PO Box 14, Petersfield, Hants GU32 1HS (tel: 073087 403).

Gary Herman

The Music Box is a new weekly column with news, reviews and readers' comments on all aspects of music and music.

Any readers with experience of computer music making or companies with new products are invited to write to: drop a line explaining what they're doing to: Gary Herman, The Music Box, 12-13 Little Newport Street, London WC2R 3LD.

Base Attack

on Vic20

This is a fun Space Wars program written for the unexpanded Vic 20 called *Base Attack*. Can you thwart the invasion of the Groggs?

Program Notes

5-10	Prints instructions and sets up screen.	230-2696
36-47	Data for characters.	
126-170	Clears the screen and gives positions for you and the Groggs.	
180-245	Puts you, your base, your boundaries and the Groggs onto the screen.	9800-10116 15000-15000

Main Routine which allows you to move left, right and fire. It also allows the Groggs to move randomly. The score routine is also contained here. Sounds an explosion and informs you that you have been invaded. Try again routine.

Signalled

Once more PNP Communications of 111 Lawes Avenue, Newhaven, East Sussex, BN9 9SB, deserve a mention. For all those Amstrad Owners out there who write into the magazine asking where the software is, ask no more. PNP is into programming the Amstrad for the radio enthusiast. Their first program for this machine is a Morse Tutor. Five modes of operation are possible. Firstly a structured tutor in itself, letters that need to be practiced can be specified. It has a library of words that can be randomly selected and text can be translated into Morse can be entered from the keyboard. In

addition, a data cassette can be prepared under program control ■ feed in when required.

Over two hundred words are available from the program's library which have been specially chosen to cover the widest possible range of letter groups. Further words or text can be loaded from a previously prepared data cassette which is useful in setting up a dummy run of the Morse test itself. A separate program is supplied to help set up the data cassette.

The speed range is from 4 to 24 words per minute which is more than adequate for the amateur. Figures are included in a separate section of the tutor although they can be mixed with letters if required. Morse Tutor for the Amstrad CPC484 costs £8.90 and is available direct from PNP.

Almost in the same breath, PNP announced a new, multi-standard RTTY/Morse code Terminal Unit. It is what they call a matched filter type unit

and it is for receive only. Aimed primarily at the serious short-wave listener, the unit is suitable for interfacing a communications receiver to any home micro. The matched filter/rectifier/integrator design makes it eminently suitable for demodulating Morse Code.

The unit consists of two active filter chains. One is fixed at 1275Hz for SPACE and the other is electronically switched to either 1445Hz for 170Hz shift or 1700Hz for 425Hz shift or 2125Hz for 880Hz shift MARK signals. It is this channel used for Morse decoding. There is also an ALC system to cater for a wide range of input signals and to compensate for fading, etc. In addition, a bar-graph type tuning indicator is provided to enable the accurate tuning of RTTY.

This terminal unit is also suitable for signals in excess of 200 baud and for the reception of AMTOR. All connections are by neat plugs and sockets and is supplied as a built and

aligned unit complete with mains transformer. At the moment, only a built unit can be supplied but PNP say that a kit will be available shortly. The PNP multi standard terminal unit costs £32.50 plus VAT and more details can be had by calling PNP on 0273 814485.

News just in for Spectrum owners is that there is now a program for the 48K Spectrum that will transmit and receive RTTY actually without any interface at all. Just load the program and go. All input and output is via the *Ear* and *Mic* sockets. I hope to review this new program very soon in *Microradio*, but until then contact GIFTU on 0246 810652 for more details.

Ray Berry

Book Ends

Book *Giant Book of Spectrum Arcade Games*
Price £3.98 Micro-Spectrum 48K Supplier Fontana Paperbacks, 8 Grafton Street, London W1X 3LR

Is there really a sub-cult of Spectrum owners who prefer to spend longer typing in a game than they will playing it? Publishers seem to think so because they continue to churn out volumes of listings, many of which are presumably destined for Father Christmas's sack.

Most of these books cause feelings of *déjà-vu* for the reviewer, but at least this one contains a few new ideas and avoids the almost inevitable adventure by concentrating on arcade games.

The inclusion of a few machine code routines give the games an edge on purely Basic

versions, and notes to aid modification are also useful, but I still fail to see the attraction of such books. At least this one is cheap.

John Minson

Book *Exploring Artificial Intelligence On Your Microcomputer*
Price £4.98 Supplier Interface Publications, 9-11 Kensington High Street, London W8 5NP

Will a computer one day write as many books as Tim Hartnell? This practical introduction to the much-discussed topic of A.I. is one of his better offerings.

Four main areas are examined: simulating thought, games playing, language recognition and expert systems. Each section contains several listings, the development and workings

of which are explained. There is also some historical context, expanded by a useful bibliography.

The lack of an index is unfortunate, and I don't like the type setting, but the inclusion of an appendix on structured programming is welcome.

While it is not perfect, this book provides a useful introduction to A.I. for owners of machines with MSX or Microsoft-compatible Basics; Sinclair owners will have to do some conversion work first, though.

John Minson

Book *Business Programming On Your Commodore 64*
Price £7.95 Micro-Commodore 64 Supplier Phoenix Publishing Associates Ltd, 14 Vernon Road, Bushey, Herts WD6 2JL

A collection of listings with a

difference, aimed not at the arcade kid but the micro-shy sales or marketing manager.

The book does not aim to teach Basic in its 150 pages, but it does explain the role of computers in an area of business where they are often neglected.

It introduces some concepts of the language, and presents various data-handling programs with lengthy comments on their construction, logic and use.

It is not an 'idiot's guide' but is user-friendly and, providing enough time is devoted to understanding the examples, it should prove useful. I suspect that its philosophy of 'write your own' is a trifle optimistic, but it could help businessmen understand and evaluate bought-in software more fully.

John Minson

Base Attack
by Steve Carr

Baud Walk

Data path

Britain's publishing companies are starting to get serious about database publishing — and that's got to be good news. The *Economist*, Pergamon, *The Guardian* all now have an involvement with electronic publishing.

Next year I predict at least two major developments from computer magazine publishing houses giving a wider choice of

services for baud walkers. Database Publishing, which publishes *Micro User* for BBC owners plans a magazine all about networking.

News International has already announced its TTNS (The Times Network for Schools) schools' network based on the public electronic mail and noticeboard service Telecom Gold and PSS.

Schools joining TTNS will be supplied with a starter pack — suitable for the BBC and Research Machines micros — consisting of a multiple baud-rate (1200/1200 half-duplex, 1200/75, 300/300, 1200/1200 pseudo-full duplex) auto-dial auto-answer modem, and the necessary software to access the network. Also supplied is a tutor program and operation

manual. The whole lot knocks out at a basic price of £152, though it is only available for schools.

With so many of the main publishing companies beginning to take such an active interest in electronic publishing, the UK Publishers' Association recently met to coordinate how best to make the information we get in print available on databases at a price people can afford.

One of their battle grounds will be with the Government, and presumably BT, in presenting the publishers' case to get the cost of data calls (as opposed to telephone calls) down.

Data paths can easily be monitored at exchanges and with BT experimenting with itemised billing, cheap data call

tariffs cannot be ruled out simply because of administration problems and the like.

The cost of modems has now come down to a sensible level, development in printing technologies are well advanced — and a cheap data rate would make good sense. After all, Prestel was invented to try and get people using the telephone more at off peak times.

Robin Wilkinson

Baud Walk is a new weekly column with news on networking, databases, reviews of modems and software and points of contact for information.

Any readers with experience of networking are asked to send their experiences or news of services to Robin Wilkinson, Baud Walk, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

He can also be contacted on Prestel mailbox 019853727.

Choosing the right computer is a good start – but can you find the right software?

At SUPERSOFT we're very conscious of the fact that people who spend several hundred pounds on computer equipment are looking to do rather more than play Space Invaders

Financial planning is a rather grand name for something you've been doing all your life – making ends meet! Perhaps if Mr Micawber had used **BUSICALC** he would have been able to balance the books a little better.

For home, club or small business use **BUSICALC 1** should pay for itself in no time at all; for larger companies we recommend **BUSICALC 3**, one of the few really valuable programs that you can learn to use in a day

Although your Commodore 64 is a powerful musical instrument you need to be a pretty good programmer to understand how it works. Unless, of course, you buy **MUSIC MASTER**!

To use **MUSIC MASTER** requires no prior musical knowledge, though in the hands of an experienced musician it will prove an invaluable tool. You don't need to know the first thing about programming either! **MUSIC MASTER** is the musical equivalent of a word processor, remembering the notes you play and allowing you to replay and edit them as you wish.

INTERDICTOR PILOT is a space flight simulator. Nowadays simulators are widely used to train pilots and astronauts because – to be frank – it's a lot cheaper (and safer) than the real thing!

Imagine, if you will, life in the 22nd century space travel in commonplace and on the outskirts of the galaxy the first war between civilizations is being fought. A shortage of trained pilots has prompted the Federation to develop a computer simulation that allows raw recruits to gain experience without paying for their mistakes with their lives. With the aid of your Commodore 64 you too can learn to pilot the Interdictor Mk 3 craft. But be warned – this is no game!

Other SUPERSOFT products include the **MIKRO ASSEMBLER** cartridge, the only assembler that's ideal for beginners yet powerful enough for the professional (most of our competitors use it!) The **VICTREE** cartridge adds dozens of commands to Basic including toolkit aids and disk commands, or on disk there's **MASTER 64**, a really comprehensive package for the keen programmer

Of course, we do also publish games programs, and with classics like **STIX**, **QUINX** and **KAMI-KAZE** in our range we are one of the market leaders. But we most enjoy coming up with the sort of programs that are going to be in use for months and years, not hours and days – the sort of programs that make you glad that you bought a computer – and glad that you bought SUPERSOFT!

You won't find SUPERSOFT products on the shelves of your local supermarket. But most specialist shops stock titles from our extensive range (and are prepared to obtain other programs to order). However you can also buy direct by sending a cheque (pre-paid orders are post free!), by calling at our offices, or over the telephone using your **ACCESS** card.

SUPERSOFT, Winchester House, Canning Road,
Wealdstone, Harrow, Middlesex HA3 7SJ
Telephone: 01-861 1166

On a budget

About the only place that Dragons pose serious threat nowadays is in adventures! It's a pity that after a slow start, software for the Welsh computer was just beginning to get into its stride when the company collapsed. For us adventurers, there wasn't much to rave about — apart from pretty dire offerings from houses like Virgin Games, there was only *Pettigrew's Diary* from Shards Software, (recently translated to the Spectrum), the *Ring* epics, *Wintersolt's* not Wagner's, and the *Dan Diamond Trilogy* from Salamander. I noticed a letter in another magazine (which shall remain nameless) from Neil Scrimgeour, who has written to The Corner on occasion. He has started a national Dragon group with Paul Grade. Neil is running the Adventure section — best of luck with it, Neil. Write to Paul Grade ■ ■ Navarino Road, Worthing, Sussex, including a SAE.

The subject of budget games continues to vex computer users. Are they the ultimate deterrent against piracy, or merely dumping grounds for dud products by less than scrupulous software houses? The first assumption is, I believe, naive, even if games are awful and are for sold 20p there will still be more copies pirated than sold — after all, they will probably only be played once or twice before being consigned to a deep dark drawer. Good games, on the other hand, are eminently collectable, and, particularly if the package includes more than just the usual bare cassette with a bit of lame

fantasy scenario, the game will be bought in its thousands. Put yourself in the place of a 12-year-old with just a few pounds in his pocket — he can only afford one or two games at a time, and he will spend it on the ones which play well and look good and professional.

Unfortunately, some software houses feel that budget games equal inferior games, but not all. Mastertronic, in particular, are well-known for their cheap packages, but the games I've seen from them are an indication of the whole range, then the quality is the equal of higher-priced products.

Now, several adventures join the ranks of Mastertronic software, with their new series, Master Adventurer. *Volcanic Dungeon* and *Black Crystal* will be well-known already, from the Carnell Software days. *Black Crystal* remains as it was, but at an incredible price of £2.99 for the six-part 180K adventure, which comes on two cassettes complete with booklet containing the first part of the "Third Continent" story. This story is continued in *Volcanic Dungeon*, also at £2.99, and which is basically the same program (one of my all-time favourites), with added graphics.

A new program, again at £2.99, is *Se-Kah of Assiah*, by Clive Wilson and Les Hogarth. This is a two-part, 96K, graphic adventure for the Spectrum and Commodore 64, and has kept me diverted for several days now. Starting in a village hard by a forbidding castle, the adventurer's task is to enter the Castle, search for (hence he is a Se-Kah, groan!) and recover the Three Great Artefacts of the Wise Ones (nothing is plain ordinary in Mastertronic's world), then escape and deposit them in final resting places. You'll find 170 locations, all depicted in nicely-drawn if blocky graphics — text input and program response is reasonably fast, and full sentence analysis is featured. One day, I'll discuss full sentence analysis in greater depth, but in passing, let me say that I often wonder just how useful this can be. I find the more prosaic two-word commands will cover most situations.

There are a couple of weird things going on with the text handler in *Se-Kah*. Type ■ 'WEST', for example, and the answer is 'That will get you nowhere', or 'West what?' — try 'W' and the desired effect is achieved.

However, *Se-Kah* is outstanding value —

it was originally intended to be marketed at £7.99, and it shows, with good graphics and generally good presentation. I can't think of any reason against rushing out to part with £2.99 in exchange for this great newcomer — if you do, take my advice, and search around the village at the very start.

A couple of weeks ago, I was talking about a program sent to me by Keith Wadham. This was a Quill'd adventure for the Commodore, and Balsak the Bulbous, aka The Great Wizard, aka Ken Matthews looked at it for me and was impressed. He mentioned it to a well-respected software house, and now it seems that Keith's program will be released very soon.

Another Quill'd adventure comes from Compass Software. It is the first in a series, and is called *Project X: The Micro Man*. It concerns the exploits of a rather ham-fisted scientist who has managed to make himself smaller than an ant. Colour is used quite well, and each object has a little associated graphic. There are the obligatory grammar and spelling mistakes, and I find it a little strange that The Quill is not mentioned in the program. Most of the puzzles are straightforward, but the scene-setting is atmospheric, and the program is reasonable value at just £3.25, including p & p. Write to Compass at: 63 Cozens Road, Norwich NR1 1JP.

Now, let The Grand Elf and I say a very big 'thank you' ■ the many greetings and good wishes we receive from fellow-adventurers who just want ■ say: "Keep up the good work — more space for The Elf...", it's nice to know that someone is on the other end of the Corner. We also get the occasional winge from you, though: "When are you going to review *Fred goes ■ the Laundry*, it's FANTASTIC (and written by my brother)" or "When are you going give us some more tips, instead of all these boring reviews?" Well, both points of view are valid, so here are a couple of hints!

■ *Golden Baton*, which seems to be the most popular Channel 8 adventure at the moment (or, at least, the one which is foxing most people):

To get past the Crabs, say *Feed Slugs* (you did get and salt them, didn't you?) — for some reason, crabs hate the sight of salted slugs.

And for those of you stuck in the railway carriage at the very beginning of another Channel 8 adventure, *Ten Little Indians*, just: *Wait, Wait* and then *Go East*. Then *Go Down*, where you will find something interesting.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Adventure Helpline

Going bananas? If you are stuck in an Adventure with nowhere to turn do not despair — help is at hand.

Reverse effect

A Garrison of Flixton, Manchester, writes:

Q In Vol 3 No 35 a reader asked you for a Poke to obtain a zero line number in a program. The Poke that you mentioned was I think a little complicated. Poke 23756,0 sets the first line number to zero, and Poke 23756,1 reverses this effect. I also have a very handy routine that makes the listing of a Spectrum Basic program very hard (if not impossible), if you make the first line of your program.

POKE 23815,256:PEEK 23815,255.

Enter this as line 0. If you want to make doubly sure that your listings are safe, then type in the above line after having got into extended mode and typed Caps Shift and 7. I hope that this information is of help to your readers.

A Not so much an answer, more a comment. The Pokes I gave in my reply work even if the Basic program is relocated in memory. Your method relies on the Basic program always starting in the same place (which of course it usually does).

Abbreviated words

Liz O'Brien of Madeley, Cheshire, writes:

Q When typing a Rem statement, I have several times used the keyword abbreviations inside the Rem, and when the program has been listed the keywords have been completely diffe-

rent from the ones I typed in. Is this normal on a Commodore 64 or is my machine faulty? Should I abbreviate words inside a Rem?

A Interesting effect this... It reminds me of the story of the computer that learned to program itself. It would appear that you have stumbled across a minor hiccup in the C64 Basic interpreter, as the manual clearly states that any characters appearing in a Rem will be listed exactly as they are entered. It would not be true to say that the effect you describe is likely to cause any problems with the programs you write, but for clarity's sake, I would use full words and not the abbreviations.

Forth Rom for ZX81

Peter Donner of Cambridge, writes:

Q I have heard that there is a Forth Rom for the ZX81, is this true and will it work with the 16K Ram pack version?

Also, does it have any printer commands? From where can I obtain a copy, or more details?

A There is indeed a Forth Rom for the ZX81, produced by Skyware Software. It supports the 16K Ram version, and also the ZX printer. You can contact Skyware at 73 Curzon Road, Bournemouth BH1 4PW.

Speeded-up Basic

Sam Evans of Cardiff, writes:

Q I have a Commodore 64 which I am extremely pleased with. However, there is one thing that I would like to know, is there any way of speeding up Basic programs. I know that machine code is a lot faster but I have enough trouble with Basic and I think that machine code might well be beyond my capabilities.

A There are a number of ways of speeding up Basic programs; the most common method is to use a Basic compiler. This effectively translates your Basic program into ma-

chine code for you, so you get the benefits of machine code program speed without the pain and anguish of actually writing it.

One other method, which achieves a much lower return, but is quite worth using, is to set the screen colour to be the same as the Border colour. This can be done by Poke 53265,Peek (53265) AND 239. Doing this results in about a five per cent increase in speed. To reset the screen to normal, use Poke 53265,Peek (53265) OR 16.

Reading the keyboard

F Bartolo of Swindon, writes:

Q I have a number of questions concerning the Colour Genie, which I hope you can help me with. How do you disable Break? How can I turn off the keyboard? How can I read the keyboard, is, detect what keys are being pressed?

A To disable Break you need to Poke 16396,123, to re-enable it you Poke 16396,201

If you disable the keyboard your programs will in fact run somewhat faster; disable the keyboard by Poke 16405,0. To re-enable the keyboard Poke 16405,1.

As far as reading the keyboard is concerned, location 18420 holds the ASCII value of the last key pressed. So by Peeking this location you will be able to detect key depression. One last point is that the function keys have the ASCII value 92-95 unshifted, and 124-127 shifted.

Atari information

D Skinner of Lowestoft, writes:

Q In your magazine, which I buy every week, you seldom have any information regarding Atari computers. Why is this? Do you have

some personal dislike for Atari?

What about some hints and tips for this machine.

A I've got nothing against Atari, I just don't get any letters from Atari owners (except this one). As is why I don't get letters from this group, I honestly do not know. Now for a bit of light relief... all Atari owners reading this, try this routine, you should get an interesting effect on your colour screen.

10 POKE 1538,141: POKE 1837,198: POKE 1538,2: POKE 2,0: POKE 3,8: POKE 2,2

Type the above in, and then press Reset... pretty, eh?

Similar statement

H Caen of Ruislip, Middlesex, writes:

Q I would like to know what the Vic 20 statement is that corresponds the Spectrum's Print At command.

My friend has a Spectrum and he is always bragging about this feature which I don't have. I am sure that you must be able to do this on the Vic, but I don't know how.

A Unfortunately, there is no equivalent of the Print At command on the Vic. You can, however, achieve the effect you want by writing a subroutine to carry out the printing for you.

Print At, as you probably know, displays at a specified line and column position on the screen. If we say that the cursor is to be moved to position X,Y on the screen before printing, then to simulate Print "tethered goal" AT 4,4, you could use the following:

40 X = 4: Y = 4: COSUB 2000: PRINT "tethered goal" 2000 POKE 781,X: POKE 782,Y 2010 POKE 783,PEEK (783) AND 254 2020 SYS 68820: RETURN

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem, Peek it to Phil Rogers and every week he will Poke back as many answers as he can. The address is Peek & Poke, PCW, 12-13 Little Newport Street, London WC2R 3LD

Week 3: Winners — S G Leggett, Bridge Road, Chessington, Surrey and C Mitchell, Wavertree Mook Road, Wavertree, Liverpool who share the £100 'pot' and receive £50 each.

Now voting on Week 5 — £50 to win

Each week Popular is compiling its own special software top ten chart — compiled by YOU.

All you have to do to vote is to fill in the form below with the names of your current three favourite software titles (or copy the form on to another sheet if you don't want to damage your magazine) and send it off as soon as possible to: Top 10, *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2H 7PP.

We will send £50 each week to the person who correctly predicts that week's top three. If there is no winner then that week's prize is automatically added to the chart on which voting is currently taking place, and so on until someone gets it right! (If there is more than one winner that week's prize — whatever the 'pot' stands at — will be split equally between all the correct entries.)

Voting for Week 5 closes at 2pm on Wednesday December 19. Entries received after that time will not be eligible for inclusion in that week's voting. Only one entry per week per person is eligible for inclusion.

New Releases

KICK OFF

Whilst *Football Manager* has fulfilled many peoples' demands for a Spectrum football game for a long time, being primarily a strategy text rather than an actual kick the ball around simulation. The Commodore got *International Soccer*, complete with large sprite players, cheering crowds and the rest, but there was nothing to touch it on the Spectrum.

That situation has changed, however, with *Match Day*, a sure fire winner from Ocean that lets you actually play a match using joystick or keyboard. Similar techniques to the Commodore game are used — the screen scrolls rather like the movement of a TV camera to follow the action as you pass the ball around, take throw ins, dive dramatically for the ball and so on.

The little men are created using a sprite routine which

makes them appear slightly transparent, although generally speaking there are relatively few colour attribute problems. You can tell which of your team has possession of the ball (or is under your control for a tackle) because his socks change colour! An idea I hope to see in more matches in future.

There are a lot of options in the game — change name, change colour, two player game, play against the computer, etc. you can head the ball, pass the ball through the air or along the ground and generally test your footballing mettle. Ideal for Christmas, I should think.

WONDER WEB

Adventure International's *Hulk* got a mixed response. The Spectrum version certainly had excellent graphic illustrations, but many people complained about the adventure itself. It was felt to be too difficult and too arbitrary — maybe people just weren't used to Scott Adams's deviceness.

Anyway, the sequel has just been released, initially on the Commodore, although with versions to follow on most other machines.

In this adventure *Spider Man* takes on Mysterio, evil impresario of tricks and illusions. The graphics are nice, pure comic book stuff and of the adventure

it's best not to speak until I've had longer with it. Suffice to say that a quick look suggests there are a vast number of options at the beginning, many of which look promising, so it shouldn't be too frustrating for beginners. Important too, it understands a wide vocabulary and complex sentences reducing your frustration levels still further.

BORING

Activision scored a winner of awesome magnitude with *Ghostbusters* but *Beamrider* is a definite plummet — quite honestly this is a £1.99 game being sold for £7.99. The plot, at least, requires little explanation: your laser ship sits on the end of various lines disappearing into the distance — like an edge on view of a flat grid.

Along this grid zoom baddies. You just blast away, occasionally a baddie is a different colour and has to be shot with a torpedo rather than a laser. Sometimes the baddies move in a different way. Amazingly boring — you have no reason to buy it unless you are a close relative of one of the programmers.

KEY PRESTO

From time to time computer magazines have printed programs which enable you to perform magic tricks with your computer, now Acornsoft has produced a commercial package for the BBC which collects some of the best computer tricks together under the title *Paul Daniels' Magic Show*.

Nothing too complicated here, though the manual explains how the tricks work and some look fairly impressive, enough to baffle aunts and uncles anyway. Not bad.

A MESSAGE

How much longer can this continue? How many companies out there are working on games which involve 'over (several) screens' moving a little person, alien, dog, cat, wombat or duck around them collecting keys, crystals, comical trinkets or power orbs? How many have wacky comic music taken from post war musicals? And when all these tedious ingredients have been stuck together, how many of them will end up with a title that alliterates, with the second word being a proper name? Can I offer a word of advice to all such companies? Stop it now. Please.

Mutant Monty, and I quote, 'has only to make his way through 40 rooms collecting gold en route and rescue the damsel in distress, there are countless aliens all set to stop him'. It is for the Commodore 64. It is by Artic. I'm depressed.

OPERA, OPERA

Tristan and Isolde, Medieval German Classic diaconistic shattering opera by Richard Wagner and now a computer game. Well, not really. This T+L has nothing whatsoever to do with the previous ones except that it involves a princess and a prince and has, apparently, been developed in Germany.

What it is is a rather strange animated graphic adventure. All allowed actions have graphic consequences — the choices you have available are made from a menu screen which may or may not give you further options, eg, if you press W for walk you get a further set of options indicating directions.

The character that represents Tristan (although he is also titled Kunibert, somewhat confusingly, in the draft manual I have) is a very bizarre looking sprite who seems only to move one leg when he walks. I don't know why.

As usual, the object of the quest is to rescue a poor woman — Isolde (although she is also called Kunigunde) so you move about picking up useful objects to get through various rooms — portrayed in a sort of 3D. So far I've been bashed by monsters almost immediately so haven't got very far.

It is quite unusual, and reasonably compelling in a funny sort of way, but I think it could

Pick of
the week

TAKE FIVE LINES

Skool Daze is such an obvious subject for a computer game it's a wonder nobody ever thought of it before (well, almost nobody). Not only is it a good idea, the programming is excellent and the graphics good enough to distinguish the different schools from one another — the swot looks snooty and the bully lumbers about.

The screen displays a cross section of the school with schoolboys milling about, different classes taking place and so on. You control one particular schoolboy — Eric (although you may rename him if you wish) — who must retrieve some not altogether favourable school reports from the school safe before the headmaster sees them.

Retrieving the report requires you to master a plot so complicated it makes *The Big Sleep* seem like Enid Blyton. Here goes (stop me if I go too fast for you). First of all, you have to make all the school shields flash by touching them — some you cannot reach and so you will need to tread on a lesser boy to reach them. This combined with attending lessons when told and leaving the school at playtime (otherwise you get lines — over 10,000 and game over) will make the masters become disorientated and, if knocked over, will give you one letter of the code of the school safe. However, the history master will only reveal his letter if you get his date of birth

and write it onto a blackboard before he enters that room (if the board is clean).

Having got all the letters, you then have to put them in various orders (you know that the Headmaster's letter is always first). To do this chalk the order of letters onto a blackboard, rush to the safe and see if it opens. Anyway... if you get an open safe you then have to rush around stopping all the flashing shields by jumping up and touching them again.

If the plot doesn't daunt you, you'll love *Skool Daze*, it really does recall images of the *Bash Street* Kids and Lord Snooty and his pals and the graphics are wonderful.

3-D FUN

3D Starstrike continues Realtime Software's flirtation with three dimensions seen most recently in its *Battlezone*-inspired 3D tank game.

3D Starstrike is a fast reflex game with several sections and plenty of vector style line graphics. The first section is pretty much a straight shoot the baddies in space before they shoot you, but the graphics are good and even the sound, usually hopeless on the Spectrum, is reasonable.

If you survive this you arrive at your target, a planet littered

with 3D skyscrapers whose tops you can blast to bits. Eventually find a duct leading to two cooling ports which, if destroyed, lead by some means or other, to the end of evil everywhere.

The duct section is particularly good fun — you appear to fly down a narrow channel with barriers blocking the way — to get through you need lightning responses to avoid hitting them. Personally, I often find multi section games a bit disjointed — the different bits too often look as though they have been bodged together to make the game a bit more interesting. Here I think it works though — the pieces slot together neatly. A must for the arcade fan.

TON UP

Motocross! is a motor cycle game for the Commodore 64 — possibly the only one. Released in America by Tronix, it has been imported and issued here by System 3 Software.

Visually it's nothing spectacular — the path is marked out by a sort of bollard arrangement and the motorcycle and rider are pretty small. However, the actual game is pretty good, apart from anything else it is astonishingly fast and really does require quick reflexes.

Not only must you guide your

bike around an increasingly difficult track but, unlike some other racing type games, the track is chock full of other riders whom you must avoid and, if possible, overtake. It proves you don't need spectacular graphics to create exciting games. Well worth a look.

thought has gone into it. Kong has escaped (again) and has taken refuge in a funfair high up on a roller coaster. You must find your way around the roller coaster clambering along the tracks up to Kong and helpless woman.

That may sound pretty boring, but the fairground music, the way the cars speed up and slow down according to the slope of the track and the general pace of the game

make it quite good fun.

FAIR FUN

Kong Strikes Back is a sequel to *Donkey Kong* which means, roughly, that you get exactly the same ideas, but with some different backgrounds and settings. So you have to move a little man around dodging things until he reaches a damsel in distress.

However, Ocean's Kong sequel is definitely better than sequels usually are, a title

This Week

Nightmare world

Over dinner the other night with an accountant friend of mine the subject of artificial intelligence came up. I, of course, was arguing, vehemently, that his job would be one of the first against the wall come the computer revolution and he, equally of course, was arguing that no computer could ever replace his ability to spot a fraudster at 20 paces.

Now, fascinating though this conversation was for a while, it occurred to me that both our conversation and many similar debates filling the pages of scientific journals at the moment, are grasping the nettle at the wrong end.

The important question to debate is if we need new technology not to speculate idly about what we believe will or won't be possible.

In any event the latter question demands a high level of scientific knowledge and foresight, whereas the former simply requires the good common sense of the man on the Clapham omnibus.

So, let us remove the need for scientists for a while by assuming that they have managed to construct a super computer/program/robot capable of carrying out any task we might wish and ask ourselves the question — what do we want it to do?

Well for a start, we can replace all the dangerous, unpleasant and repetitive jobs such as coal mining, rubbish collection and factory-line assembly. The wealth of human talent released could be re-employed in

management jobs and the like by the boom created through cheaper energy and manufacturing costs.

Why stop there? Our super computer could also replace these new management jobs. It could run all aspects of industry from process and control to marketing leaving the workforce free to take life easy doing whatever gives them pleasure.

Indeed the last area of human endeavour would be in the leisure field. A small elite of mankind would be exploiting their artistic talents keeping the rest of us entertained.

This, incidentally, is very much the kind of utopian 'golden age' that Sir Clive Sinclair keeps telling us we are on the brink of achieving.

But, now remember my premise that the super computer can replace any human task (only faster and better) — even these few jobs could go leaving all of us listening to computer-generated music and TV pictures or reading computer written and published books whilst eating our computer cooked dinners!

A nightmare? Definitely. We shouldn't be discussing if we can make these machines, but rather how we can stop them being made, which is not as easy as it might seem.

We live in a world economy. To be successful we need to compete for business. If the Japanese and Americans install computers to mine their coal and oil or build their cars cheaper and better then we must, as a capitalist, non protectionist, world, do the same.

This upward spiral of automation has been continuing for centuries and the pace of development of technology has always kept pace with our desire and need to use it. I see no reason to suppose that this trend will come to an end now unless we actively intervene and do something about it.

I am no Luddite but unless we do something immediately we will head inexorably for the nightmare world I've described.

Glen Counsell

The Hackers

Hello sir, how about a computer to help you in business?
No thanks.

Ah! Well, would you like a computer for your children?

Ok, - that seems like a fair swap.

Squared ages

Puzzle No 137

Professor Otto Hax was browsing through some back copies of *Mathematical Monthly Miscellanea*, the popular journal for all number freaks, that has just celebrated its fiftieth anniversary. One of the items which attracted his attention was the following:

"Readers may be interested to know that this year is a very important one for London mathematics teacher Mrs Annie Nutt. It has been pointed out that Mrs Nutt, her daughter, and her grand-daughter all have ages (in years) whose squares are in arithmetical progression. In other words, the difference between Mrs. Nutt's age squared and her daughter's age squared is the same as the difference between her daughter's age squared and her grand-daughter's age squared. But what is even more remarkable is that this difference is exactly equal to the present year!"

Unfortunately, the ages were not given but the Professor, assuming that the ages were biologically and legally possible, was able to work them out. But then, of course, he did have the advantage of knowing the date of the journal.

Can you determine what these ages were, and say in which year this curious coincidence took place?

Solution to Puzzle 132

I took books numbers 2, 5, 8, 9 having respectively 89, 147, 168, 192 and 204 pages. This makes a total of 800 pages.

The program puts the values representing the number of pages in each book into an array. The five *For/Next* loops then call these values in sequence and test the totals to determine if it equals 800.

```
10 DIM A(10) 20 DATA 54, 89, 107, 111, 147, 168, 178,  
192, 204, 241 30 FOR N = 1 TO 10 READ X 40 READ X 50 LET  
ACR = X 60 NEXT N 70 FOR T = 1 TO 6 80 FOR Q = P  
+ 1 TO 7 90 FOR R = Q + 1 TO 8 100 FOR S = R + 1 TO  
9 110 FOR T = S + 1 TO 10 120 LET X = A(P) + A(Q) +  
A(R) + A(S) + A(T) 130 IF X = 800 THEN PRINT  
A(P), A(Q), A(R), A(S), A(T) 140 NEXT T 150 NEXT S 160  
NEXT R 170 NEXT Q 180 NEXT P
```

Winner of Puzzle No 131

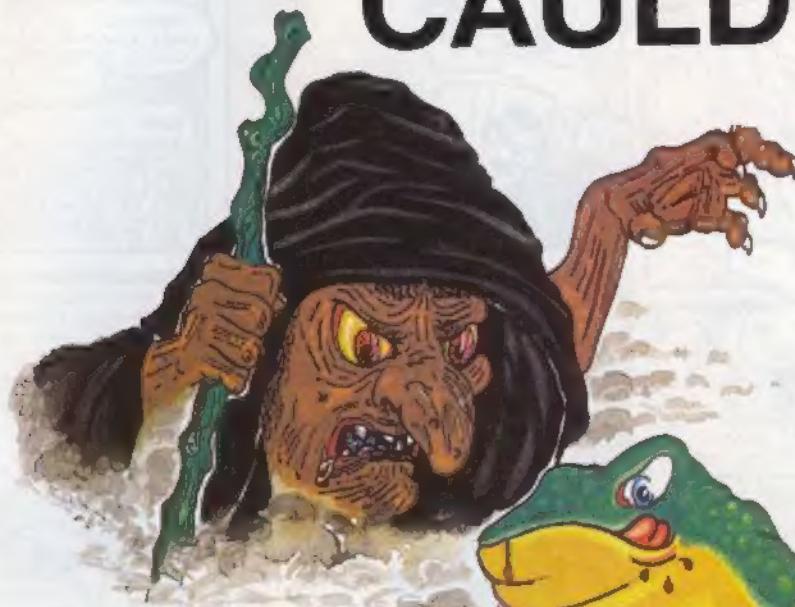

The winner of Puzzle No 132 is Phil Arney of Hillmorton Rd, Esher, Surrey, who receives £10. Rules

If the puzzle can be sensibly solved using a computer, then the winner will have included a listing of the program used to find the correct answer. The closing date for Puzzle No 137 is December 28.
